NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Inclosed Overload Safety Relay

Protection against overload for alternating-current motors equipped with starters or switches having low-voltage protection is afforded by a relay manufactured by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

The relay is inclosed in a sheet-steel case which excludes dust and foreign particles of all kinds. The cover of this case is secured by two thumb screws and is provided with a safety device which automatically trips the relay when the cover is removed, thus rendering all parts of the relay "dead" as long as the cover remains off. This facilitates inspection and repairs. The relay operates by means of magnet coils which are inactive at loads less than that for which they are set. When the current value reaches or exceeds this setting the coils lift plungers which break the control circuit and operate the low-voltage relay to open the line circuit. With no current flowing in the line the coils are de-energized and the relay is automatically reset, the bridge being pressed against the contacts by means of a compression spring. The plungers operate in oil dash-pots, providing a time element which allows the relay to carry a momentary overload without tripping.

This time limit is adjustable by means of a small perforated disk in the dash-pot which is readily accessible by unscrewing the dash-pot from the casting which holds it. To prevent acci-

dent bridge away from the contacts. When the cover is fastened in place this spring is depressed by a pin on the cover, thus allowing the contact to be made between the contacts and the bridge. These relays are made in all commercial frequencies and voltages and in capacities of 5 amp. to 300 amp.

Motor-Driven Gasoline Sprayer for Automobiles

A small portable machine for spraying gasoline as a cleaning medium is being manufactured by the Midvale Machine Works, St. Louis, Mo. This machine can be used for applying waterproofing or finishing coats to automobile tops or for repainting wire or wood wheels. It also finds application for

PORTABLE MACHINE WEIGHS 190 LB.
COMPLETE

quickly applying any liquid to automobile bodies or metal parts. The machine consists of a Midvale-type duplex-cylinder compressor mounted on a portable roller base, with an air-pressure tank, air cleanser and renovator, relief pressure valve, 6 ft. (1.8 m.) of rubber tubing, an air cock and a vapor gun with a glass cup container. The outfit complete weighs 190 lb. (86.1 kg.).

Small Testing Instrument

Light-weight and small testing am-meters, voltmeters and wattmeters for alternating and direct current of the dynamometer type have been placed upon the market by the General Electric Company of Schenectady, N. Y. The manufacturers claim that these are the smallest and lightest practical sets of instruments on the market that are applicable to all commercial frequencies and wave forms without appreciable error. These ammeters and wattmeters are furnished only for se-

ries current rating up to and including 20 amp. The wattmeter is single-phase, but can be furnished with double voltage potentials if desired. The ammeter is of the iron vane type. The windings are magnetically shielded and equipped with an air damper. The instrument

SMALL AND LIGHT-WEIGHT TESTING
WATTMETER MAY BE EASILY CARRIED

case with a window in the cover over the scale plate forms the carrying case. The dimensions of the instrument are approximately 4.75 in. by 4.37 in. by 2.6 in. (12 cm. by 11.1 cm. by 6.5 cm.). Voltmeters and wattmeters of this type for 600 volts have also been developed. The cases in these instruments, however, are slightly larger to care for the additional resistance.

Serviceable Cover for Push- Button Switches

The liability of moisture, gas or dust getting into the operating parts of push-button switches is entirely eliminated, according to the Crouse-Hinds

BEARINGS ARE WELL SEALED WITH A
HARD GREASE

Company, Syracuse, N. Y., in a cover that it has recently placed upon the market. This device is designed to be installed in one-gang or two-gang condulets of either the FS or FD series, and it consists of a cover with a switch-operating mechanism. Like the con-

RELAY AUTOMATICALLY TRIPS WHEN
STEEL COVER IS REMOVED

dental change of adjustment from vibration or jar a spring lock is provided which holds the dash-pot firmly in place. The safety device by which the relay is tripped on removal of the cover is a flat looped spring which when free to act holds the contact

dulet, the cover is a casting, either iron or brass as specified. The mechanism which operates the push-button is under the dome of the cover and is controlled by a shaft flattened at its inner end and extending through the side of the cover, where it terminates in the operating handle. That portion of the shaft which passes through the cover is provided with grooves containing hard grease which effectually seals the bearing, and a rubber gasket likewise seals the joint between the cover and the conduit. On-and-off indicators cast on the ends of the handle facilitate the operation of the switch.

With this cover and the necessary conduit it is now practicable to use push-button switches in places where excessive moisture, explosive or corrosive vapor or fine dust circulates in the atmosphere, as in ships, ammunition plants, refineries, textile and flour mills.

Industrial Tractors

A line of electric tractors for use in factories, shops, etc., has been placed upon the market by the Industrial Truck Company, Holyoke, Mass. The tractors are manufactured in two types with end or center control and with either two-wheel or four-wheel drives as desired. Removable side doors are provided for changing batteries, and the inner top plates on the tractor allow easy access for flushing or inspection. The battery equipment is of the Edison or lead-plate type as desired. The frame and battery box can be lifted from the cabinet, leaving the entire driving mechanism accessible for inspection or repair. Power is transmitted from the motors to a single reduction worm and gear differential and a universal joint to the wheels. The universal joint is inclosed in a dust-proof and oil-proof case, and it is capable of operating at an angle of 43 deg. Two brakes are provided, one operated by the left foot and the other operated by the right. To operate the tractor the driver must be sitting in the seat

TRACTOR WITH COMPLETE ARRANGEMENTS FOR SAFETY

with his left foot pressing on the emergency brake pedal. On removing the foot from the left pedal the brake is applied, the controller handle is thrown off, and the controller is placed in neutral position. After this has happened it is impossible to start again without

first releasing the emergency brake and bringing the controller back to neutral.

An additional safety device is found in the tilting steering wheel, which is so placed that the operator must tilt the wheel to leave his seat. This arrangement is connected with the controller shaft clutch so that the battery current cannot be applied until the wheel is in running position.

Solderless Wire Terminal

Great conductive capacity is obtained by a solderless terminal that has been placed upon the market by the Cruban Machine & Steel Corporation, 2 Rector Street, New York City. Each strand of the cable comes in direct contact with the lug body. An absolutely firm contact is obtained, and it is impossible to pull out the wire without destroying either the lug or the wire. The wire can be taken out of the lug with-

WIRE CANNOT BE PULLED OUT WITHOUT INJURING LUG OR CONDUCTOR

out injuring the wire or the lug. The grip of this lug is in no way affected by excessive heating. The cross-section in the illustrations shows the body, the lock nut and the cable. The wire strands of the cable are bent back on to the smooth part of the lock nut. To attach, the end of the cable must be cleaned of all insulation for about 9/16 in. (14.3 mm.). The insulated part is then slightly tapered on the edge, so that the lock nut can be screwed in over the insulation as shown in the figure. This connector is known as the "Cruban" solderless wire terminal, and may be used wherever stranded conductors are in service.

Current-Limit Automatic Controller for Motors

An automatic controller consisting of a number of lock-out accelerating switches having series-wound coils has been placed upon the market by the Industrial Controller Company of Milwaukee, Wis. The rate at which the motor accelerates up to full speed is

limited by the current in the armature—under light loads the motor will start rapidly, under heavy loads more slowly. The motor will accelerate to full speed in the quickest possible time consistent with safety.

This device is known as a "unit panel

COMPLETE UNIT-PANEL CONSTRUCTION CONTROLLER FOR ACCELERATING MOTORS

construction" controller—that is, each accelerating unit, contactor, overload relay and knife switch which may be used with the complete controller is mounted on a separate panel. The panels are in turn mounted on a frame completing the controller. Each of the accelerating unit panels also carries the necessary resistance units. This panel construction permits very easy replacement or additions.

Solid copper contact fingers are furnished with these controllers, laminated brushes being entirely eliminated. The controllers are arranged so that inclosing covers may be easily attached to the standard frames when desired. These controllers are particularly adapted for use with all types of machine tools, centrifugal pumps and fans, blowers, etc.

Platform Electric Washer

Lifting of water is eliminated in a platform electric washer that has been placed upon the market by Voss Brothers Manufacturing Company, Davenport, Iowa. The washer is placed on one end of the platform with the motor on a shelf immediately beneath it. Tubs for hot and cold water can also be placed upon the platform, and the wringer is placed at the opposite end with a basket for receiving the dry clothes. The wringer is operated by means of a rod drive parallel to the platform. To drain the wash tub and rinse tub when through washing it is only necessary to open the pipe in the wash tub and pull the plug at the bottom of the rinse tub. The double wringer control allows the operator to control the wringer either by hand or by the foot pedal at the bottom of the machine. While using the foot pedal the operator has both hands free to handle the clothing.

Trade Notes

JOHN F. GODFREY, manufacturer of coal handling conveyors, has removed his plant from Elkhart, Ind., to Chicago.

THE KILG ELECTRIC METER COMPANY has removed its plant from Indianapolis to Richmond, Ind. Its capitalization will be \$125,000.

THE MOLONEY ELECTRIC COMPANY, St. Louis, Mo., announces that J. Van Burskirk, formerly associated with the Mineralac Company of Chicago, has just been appointed manager of the Chicago office.

THE ELECTRICAL ENGINEERS' EQUIPMENT COMPANY of Chicago has appointed the Beidle Equipment Company, 1309 and 1310 Union Trust Building, Cincinnati, Ohio, district representative for that city and the surrounding territory.

THE DETROIT ELECTRIC SALES & SERVICE COMPANY of Detroit, Mich., is erecting a new building, an addition to its plant, two stories high and 200 ft. by 400 ft. in size. When completed the company will have 160,000 additional sq. ft. of floor space.

THE JEFFREY DEWITT INSULATOR COMPANY, the new corporate name of what was formerly the Dewitt-Jeffrey Company, manufacturer of the J-D high-tension suspension insulator, will be operating its new plant at Kenova, W. Va., on June 1. Its offices will be in the first National Bank Building, Huntington, W. Va.

THE HOLTZER-CABOT ELECTRIC COMPANY, Roxbury, Mass., announces that its business in motors, dynamos, motor-generators, etc., previously conducted by the James Goldmark Company, 83 Warren Street, will be hereafter handled from its New York office at 101 Park Avenue, corner of East Fortieth Street. Douglas Cairns is in charge of the New York office.

J. BECKEL, secretary of the Ministère de l'Industrie et du Travail, 15 Boulevard de Strasbourg, Havre, France, requests American manufacturers of electrical apparatus, machinery, supplies and specialties to send him their catalogs, together with such technical information as might be useful or interesting to future possible buyers. These catalogs will be filed and indexed, and placed at the disposal of Belgian manufacturers and buyers as soon as the war is over.

THE HOOVER SUCTION SWEEPER COMPANY of New Berlin, Ohio, still has its plant and general offices in that place, now known as North Canton. Owing to the prejudice against German names and at the request of its people, the name of the town, which is virtually a suburb of Canton, has been changed as just indicated. From July 8 to 13 a meeting of the twelve division sales managers will be held at the Hoover company's factory, and it is understood that one of the main topics to be discussed will be that of prices.

COMMERCIAL AGREEMENT WITH NORWAY.—The War Trade Board announces that in consequence of the conclusion of a general commercial agreement with Norway exports of commodities embraced in the schedules attached to the agreement are about to be resumed. Exports from the United States will be licensed subject to the general policy of conservation and to the general rules and regulations of the War Trade Board. Shipments will only be made on vessels flying the Norwegian flag and the total exports are limited in quantity.

THE AMERICAN TRADE ACCEPTANCE COUNCIL of New York City will hold a special all-day trade acceptance session at the LaSalle Hotel, Chicago, on June 17. The National Association of Credit Men will also hold its annual convention at the same hotel on the preceding day. Paul Warburg, deputy governor of the Federal Reserve Board, will address the trade acceptance meeting. A representative attendance is expected of the trade acceptance committee men of the forty-eight state banking associations and committeemen appointed in the various industries, also of officers and directors of the more prominent trade and commercial organizations, besides leading bankers, manufacturers, merchants and students of economics.

THE GENERAL VEHICLE COMPANY, INC., and the Walker Vehicle Company make the following announcement: "On account of the existing national emergency it has become imperative, in the interest of winning the war, that the General Vehicle Company, Inc., vacate the plant at Long Island City. In order to conserve the interests of the many users of G. V. trucks, the General Vehicle Company, Inc., has

made arrangements with the Walker Vehicle Company, Inc., of Chicago, Ill., to supply spare and repair parts and to furnish repair service to users of G. V. trucks. It is expected that this arrangement will result in the same satisfaction to G. V. users that they have enjoyed in the past. In general, stocks of spare parts will be carried as requirements determine, the principal stock being carried in Long Island City. After this date will you please communicate with the nearest Walker branch or dealer for parts or service."

Trade Publications

SWITCHES.—The Matthews "fuswitch" is described in a circular distributed by W. N. Matthews & Brother, Inc., 3727 Forest Park Boulevard, St. Louis, Mo.

WIRE TERMINALS.—The Cruban Machine & Steel Corporation, 2 Rector Street, New York City, has issued a circular describing its solderless wire terminal.

RHEOSTATS.—Universal battery-charging rheostats for garage duty are described in circular No. 501, issued by the Ward Leonard Electric Company of Mount Vernon, N. Y.

LAMP RENEWERS.—Lamp renewers for both series and multiple lamps are illustrated and described in a circular issued by the G. C. A. Manufacturing Company of Pittsfield, Mass.

PORTABLE INSTRUMENTS.—The General Electric Company of Schenectady, N. Y., has issued bulletin No. 46,018A, describing and illustrating its type P-8 voltmeter, wattmeter and ammeter.

WASHING MACHINES.—Voss Brothers Manufacturing Company, Davenport, Iowa, has issued an illustrated circular describing its latest model-platform, peg-type and vacuum-type washing machines.

RESISTANCE UNITS.—Enameled resistance units are illustrated and described in a booklet that has been issued by the Ward Leonard Electric Company, Mount Vernon, N. Y. Prices of the resistance units are also given.

SWITCHES.—A two-color folder, publication No. 252, has been issued by the Cutler-Hammer Manufacturing Company of Milwaukee, Wis., describing and illustrating its "seventy-fifty" switch for use with electric appliances.

FIELD RHEOSTATS.—The Ward Leonard Electric Company of Mount Vernon, N. Y., has issued some general information on field rheostats in a bulletin. Dimensions, price lists and illustrations of the rheostats are given in the booklet.

STOKERS.—The Combustion Engineering Company of New York has issued bulletin CI, describing its Cox stokers. This booklet is profusely illustrated with actual installations and shows diagrams of several different kinds of boiler settings.

CONDULETS.—Motor-switch condulets are described in bulletin No. 1000H, now being distributed by the Crouse-Hinds Company, Syracuse, N. Y. Its new steam-type cover with switch-operating mechanism for single and two-gang series conduit bodies is also illustrated in a photo of an actual installation.

MECHANICAL DRIVE.—The Poole Engineering & Machine Company of Baltimore, Md., has issued circulars describing the application of its turbo-gear for rubber-mill drive, pump drive, line-shaft drive, cement-mill drive, belt-conveyor drive, fan drive, air-compressor drive, centrifugal-pump drive and stoker drive.

STEAM TURBINES.—The Terry Steam Turbine Company, Hartford, Conn., is distributing a vacation schedule for 1918 that can be used to show graphically the vacation periods of any number from one to twenty-five employees. Some of the Terry products are shown on the schedule. Copies of this publication will be furnished on request by the company.

INSTRUMENTS.—Engineering instruments are described in a bulletin that is being distributed by James G. Biddle, 1211 Arch Street, Philadelphia. Some of the instruments are meggers for testing electrical resistance of conductors or insulations, hand tachometers, vibrating reed tachometers, reed frequency meters, portable switchboard electrical instruments and rheostats.

ELECTRIC DISTRIBUTION SPECIALTIES.—The G. & W. Electric Specialty Company of Chicago has issued a very complete catalog describing and illustrating its several distribution specialties. In this bulletin series cut-outs, filling compounds, ground-pipe caps and points, primary cut-

outs and fuses, line disconnectors, cable and conduit hangers, outlet hoods, potheads, sub-way cut-outs, distribution boxes, switching boxes, splice boxes and tap boxes are described.

LINE MATERIAL AND ELECTRIC RAILWAY SPECIALTIES.—A complete and comprehensive catalog has been issued by the Drew Electric & Manufacturing Company, Indianapolis, Ind., describing and illustrating its overhead line material and electric railway specialties. It is known as catalog No. 18 and contains specifications and photographs of splices, trolley frogs, trolley crossings, adjustable crossings, section insulators, approachers, triple-beam insulators, pole brackets, line suspensions, feed-in hangers, insulated hangers, cap-and-cone hangers, globe strain insulators, giant strain insulators, standard insulated bolts, porcelain strain insulators, etc. It also contains various accessories used on electric railways. High voltage porcelain insulators are extensively treated, and diagrams are given illustrating construction and sizes. Glass insulators are also described and illustrated.

New Incorporations

THE FREEMAN ELECTRIC COMPANY of Cleveland, Ohio, has been incorporated by Katherine Freeman and Louis Kronenberg.

THE BORDER POWER COMPANY of New York, N. Y., has been chartered with a capital stock of \$10,000 by S. B. C. J. and J. L. Sauer of New York City.

THE LOCO (OKLA.) LIGHT & FUEL COMPANY has been chartered with a capital stock of \$25,000 by Percy W. Newman and W. H. Rader of Loco and G. W. Newman of Dixie, Okla.

L. R. WOOD, INC. of New York, N. Y., has been incorporated with a capital stock of \$50,000 to manufacture electrical goods. The incorporators are M. H. and L. H. Wood and C. F. Hoffman, 49 Wall Street.

THE PINE BLUFF BATTERY COMPANY of Pine Bluff, Ark., has been chartered by R. G. Craig, Gordon M. Rudd and others. The company is capitalized at \$10,000 and proposes to manufacture electric batteries.

THE ROMMEL-GUSSET COMPANY of Louisville, Ky., has been incorporated by John D. Rommel, W. A. Gusset and W. A. Turner. The company is capitalized at \$10,000, and proposes to manufacture storage batteries.

THE ANGOLA (IND.) ELECTRIC MANUFACTURING COMPANY has been incorporated with a capital stock of \$150,000 by Samuel C. Wolf, Edward C. Kolb and Carl A. Redding. The company proposes to manufacture machinery.

THE INDUSTRIAL APPLIANCES CORPORATION of New York, N. Y., has been incorporated by J. J. Sullivan, N. V. Rothenberg and M. C. Kahl, 35 Nassau Street. The company is capitalized at \$10,000 and proposes to manufacture telephone and telegraph devices.

THE STANDARD ELECTRIC ENGINEERING COMPANY of Hammond, Ind., has been chartered by A. R. Stowell, George M. Chapin and Roy W. Weir. The company is capitalized at \$100,000 and proposes to manufacture electrical and mechanical apparatus.

THE ELECTRIC RIVETING CORPORATION has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$1,250,000 to manufacture machinery for electrical riveting. The incorporators are C. L. Rimlinger, M. McLancy and F. A. Armstrong.

THE INTERNATIONAL INSULATING CORPORATION of New York, N. Y., has been incorporated by O. and Heineman, 25 West Forty-fifth Street, and J. Schecter, 10 Wall Street, New York City. The company is capitalized at \$60,000 and proposes to manufacture insulating materials.

THE MASTER TELEPHONE SYSTEM OF THE BRONX, New York, N. Y., has been incorporated with a capital stock of \$75,000 by L. Poster, 2126 Vyse Avenue; R. Carlin, 945 East 181st Street; M. L. Heller, 2126 Vyse Street, the Bronx. The company proposes to deal in electric sound transmitting devices.

THE IROQUOIS UTILITIES, INC., of Syracuse, N. Y., has been organized by the consolidation of the Randolph Light & Power Company and the Gowanda (N. Y.) Light & Power Company. The company is capitalized at \$165,000, and the incorporators are A. M. Ellis, B. H. Shepard and L. S. Chapman of Syracuse.

New England States

CHARLESTOWN, N. H.—The local substation of the Fall Mountain Electric Company was recently destroyed by fire, causing a loss of about \$20,000. The main office of the company is located at Bellows Falls, VT.

RUTLAND, VT.—Plans are being considered by the Rutland Railway, Light & Power Company for extensions to its system. A large number of industries using steam power in this vicinity are contemplating changing the motive power in their plants to electricity.

STOUGHTON, MASS.—After being without street lamps for several weeks the citizens at a special town meeting voted to appropriate \$11,000 for lighting the town.

TURNERS FALLS, MASS.—The Franklin Electric Light Company has petitioned the State Board of Gas and Electric Light Commissioners for permission to issue \$25,000 in capital stock, the proceeds to be used for extensions to its local system.

WORCESTER, MASS.—Contract has been awarded by the W. H. Sawyer Lumber Company, 66 Lincoln Street, to L. Rocheford & Son, 44 Front Street, Worcester, for construction of the proposed addition to its boiler plant. The company is also contemplating other extensions to its works.

BRIDGEPORT, CONN.—Contract has been awarded by the United Illuminating Company to Casey & Hurley, 120 Pequonnock Street, Bridgeport, for the erection of an addition 50 ft. by 80 ft. to its plant.

HARTFORD, CONN.—Bids, it is reported, are being asked by the Terry Steam Turbine Company of Hartford for erecting an additional story to two sections of its plant, 40 ft. by 100 ft. and 20 ft. by 200 ft. respectively. The capital stock of the company has been increased from \$350,000 to \$700,000.

MONTVILLE, CONN.—Permission has been secured and all arrangements made with government officials and others interested by the Eastern Connecticut Power Company for the construction of an electric generating plant across the Thames River near Bartlett's. The proposed work will include the erection of high-tension aerial cables across the Thames River at Montville, which will swing from steel towers on either side of the river, and it has been decided that the minimum clearance shall be 175 ft. Power generated at the plant will be furnished principally to the submarine base near New London; also to the town of Groton and other towns and industries in that district. Fred T. Ley & Company of Springfield, Mass., have contract for construction of the plant.

NEW BRITAIN, CONN.—Contract has been awarded by the New Britain Machine Company to the Abertshaw Construction Company of Boston, Mass., for the construction of a factory, 114 ft. by 340 ft., to be erected on a site recently acquired on the Berlin branch of the New York, New Haven & Hartford Railroad Company.

Middle Atlantic States

ALBANY, N. Y.—Contract has been awarded by the State Board of Health to Gagen & Butler, 1402 Broadway, New York, for electrical work in connection with the construction of the new laboratory to be erected on New Scotland Avenue. The cost of the work is estimated at \$10,484.

BROOKLYN, N. Y.—Plans have been filed by the Edison Electric Illuminating Company of Brooklyn for extensions and improvements to its plant on Gold Street, including the erection of an addition to power house. Contract has been awarded to John H. Duncan, foot of Sixty-sixth Street Brooklyn.

BROOKLYN, N. Y.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, D. C., for the erection of a new structural shop at the Brooklyn Navy Yard, to cost about \$1,000,000. The bureau, it is reported, is considering the construction of a series of drydocks at Weehawken, N. J., to cost about \$8,000,000.

BUFFALO, N. Y.—Plans have been filed by the Buffalo General Electric Company for an addition to its generating plant on Staats Street, to cost about \$33,700.

BUFFALO, N. Y.—The Buffalo Cereal Company is planning to construct and equip an electric power plant in connection with its proposed new grain elevator and mill at Abbott Road and the Lake Shore Railroad.

BUFFALO, N. Y.—Plans have been filed by Cousins & Sons, 74 Wabash Street, and contract awarded to B. I. Crocker, 57 Builders' Exchange, Buffalo, for the construction

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

of a new boiler plant at its works at Hopkins and Tift Streets.

BUFFALO, N. Y.—A new switchboard building will be erected in connection with the proposed new plant under construction by the Linde Air Products Company at Broadway and Ideal Streets, to cost about \$60,000. J. W. Cowper, Fidelity Building, is contractor.

DEPEW, N. Y.—The Gould Storage Battery Company is contemplating the construction of an addition, about 75 ft. by 90 ft., to its plant.

FAIRPORT, N. Y.—Plans have been prepared by the Douglas Packing Company for an extension, 50 ft. by 75 ft., to its power house on John Street. A. S. Crocker, Mechanics Institute, Rochester, is engineer.

HUDSON, N. Y.—Bids will be received by Mrs. Annie Winsor Allen, president of the board of managers of the New York State Training School for Girls, Hudson, until June 14 for repairs to boiler settings at the New York State Training School for Girls at Hudson. Drawings and specifications may be obtained at the Department of Architecture, Capitol, Albany. Lewis F. Pilcher is state architect.

NEW YORK, N. Y.—The Public Service Commission has granted the application of the New York Telephone Company for an increase in capital stock of \$25,000,000.

NEW YORK, N. Y.—Plans have been prepared by Warren & Wetmore for the erection of a new building for the Mexican Telegraph Company and the Central and South American Telegraph Company on Broad Street, between South William and Stone Streets. The general contract has been awarded to John I. Downey, 410 West Thirty-fourth Street.

OSSINING, N. Y.—Bids will be received by the Commission on New Prisons, Room 618, Hall of Records, New York City, until June 27 for electric work, including underground electric conduit and feeder system, for registration building No. 1; outside cell block No. 2; detention building No. 5; outside cell block No. 7; clinic building No. 8, and pump house at Sing Sing Prison, Ossining. Specifications may be consulted at the office of the warden of Sing Sing Prison, Ossining; at the office of the Commission on New Prisons, Room 618, Hall of Records, New York City; the New York office of the Department of Architecture, Room 1224, Woolworth Building, and at the Department of Architecture, Albany, N. Y.

POUGHKEEPSIE, N. Y.—Improvements are contemplated to the waterworks system, including the installation of new electrically operated pumping machinery, a reserve boiler and a new pre-filter bed. The cost of the proposed work is estimated at \$65,000.

SCHENECTADY, N. Y.—The Schenectady Illuminating Company has petitioned the Public Service Commission for authority to acquire the property of the East Creek Electric Power Company of St. Johnsville, which operates an electric plant on East Canada Creek, supplying the bulk of the power to the Edison Electric Light & Power Company of Amsterdam; also to purchase the plant and system of the Edison Electric Light & Power Company, which has franchises in the city of Amsterdam, the town of Amsterdam, village of Fort Johnson and in Schenectady County.

SYRACUSE, N. Y.—Investigations are being made by Prof. A. R. Acheson, consulting engineer of the Bureau of Gas and Electricity, relative to making changes in the ornamental lighting system in Syracuse. It is understood that the lighting commission will ask that some special arrangement be made for lighting the downtown section during the remainder of the war, with a view toward saving fuel and in co-operation with the fuel administration. It is expected that the illumination will not be so elaborate as during the past few years. The new contract with the Syracuse Lighting Company for street-lighting must be made before July 1.

WARSAW, N. Y.—Plans have been prepared by the Warsaw Elevator Company for an addition to its power house. C. E. Ketchum is president.

WATERTOWN, N. Y.—Plans are being prepared by the Northern Utilities Company for a hydroelectric development at Black Carthage, to cost approximately \$500,000. E. A. Rogers is vice-president and general manager.

WATERVLIET, N. Y.—Bids will be received by the Board of Water Commissioners, City Hall, Watervliet, until June 25 for furnishing material and constructing extensions to the filter and pumping station of the municipal water-works system. The work will include the installation of four additional 500,000-gal. mechanical filter units with extensions to superstructure and piping of present filter plant on the Shaker Road west of the city of Watervliet, together with furnishing and installing a motor-driven centrifugal pump on foundations, with all necessary piping and appurtenances in the pumping station at French's Mills. Plans and specifications are on file at the office of the Board of Water Commissioners, Watervliet, and also at the office of Solomon, Norcross & Keis, Atlanta, Ga.

ATLANTIC CITY, N. J.—John Stafford has awarded contract to the Baird-Osterhout Company for furnishing and installing electric-light and power system, fire-alarm system and public telephone system in the building to be erected at Brighton Avenue and the Boardwalk, at \$62,000.

BORDENTOWN, N. J.—Bids will be received at the Department of Architecture, State House, Trenton, N. J., until June 18 for general plumbing, heating and electric work in connection with alterations to tenements, Manual Training and Industrial School at Bordentown. Bids will also be received at the same time and place for general, plumbing, heating and electric work in connection with an administration building and principal's house at the Manual Training and Industrial School, Bordentown. Plans and specifications may be obtained upon application to the Department of Architecture upon deposit of \$25 for each set of plans.

HOBOKEN, N. J.—The business of the Bijur Motor Lighting Company of Hoboken has been purchased by the General Electric Company. The company will vacate its new plant and will occupy its old building again. The new Bijur plant will be turned over to the Remington Arms U. M. C. Company, which will make extensions to same for the manufacture of small-arms ammunition. New equipment will probably be purchased soon.

LANDING, N. J.—The Atlas Powder Company of Landing has contracted with the New Jersey Power & Light Company of Dover for furnishing additional power needed to operate its works. The powder company will use about 150,000 kw.-hr. per month, and a connected load of about 300 kw. will be required. Plans are being considered by the New Jersey company for extending its transmission lines to the plant at Landing. The cost is estimated at \$5,800.

NEWARK, N. J.—Bids will be received by the Board of Education of Newark until June 10 for general supplies, including electric lamps, electrical supplies, hardware, etc. Specifications and proposal blanks may be obtained at the office of the Department of Supplies, third floor, City Hall, Newark. R. D. Argue is secretary.

NEWARK, N. J.—Contract has been awarded by the Maas & Waldstein Company, Avenue R and Passaic River, Newark, to Henry M. Borems & Company, 36 Orange Street, Newark, for the construction of a boiler and nitrating chemical works, to cost about \$65,000. The buildings will be 55 ft. by 215 ft., and 55 ft. by 128 ft., respectively, one story high. The Maas & Waldstein Company also contemplates the erection of a foundry, 30 ft. by 40 ft., at its chemical works.

PAIK RIDGE, N. J.—The Board of Utility Commissioners has handed down an order requiring the local electric lighting company to make various changes and improvements to its system.

PERTH AMBOY, N. J.—The Standard Underground Cable Company, 26 Washington Street, has purchased a site in Woodbridge Township on which it proposes to erect a large new plant. The company manufactures wires, cables, etc.

PASTON, PA.—Notice has been filed with the Public Service Commission by the Pennsylvania Power Company of an issue of \$10,000 in bonds, the proceeds to be used for extensions, improvements, etc.

HARRISBURG, PA.—A special meeting of the stockholders of the Harrisburg Light & Power Company has been called for July for the purpose of voting on the proposal to increase the capital stock from \$10,000,000 to \$10,500,000 to provide for extensions and improvements to its system.

HILLSVILLE, PA.—Preparations are being made by the Bessemer Limestone Company for the installation of an electric haulage system at its Hillsville plant. The present plans provide for an expenditure of about \$60,000 in the partial installation. The cost of the complete equipment of the works is estimated at about \$20,000.

MEADVILLE, PA.—The Northwestern Electric Service Company is planning to extend its electric lighting service to Kearsage in the near future. C. M. Hatch is manager.

PHILADELPHIA, PA.—Plans have been prepared by the Philadelphia Range Boiler Company, 2021 North Tenth Street, for the construction of an addition to its works. Other improvements are also contemplated.

PHILADELPHIA, PA.—The Philadelphia & Reading Railway Company, Reading Terminal, is considering the construction of a two-story signal tower and battery building at Manville Junction, N. J., for which plans have been prepared.

PHILADELPHIA, PA.—Plans have been filed by the Bellevue Worsted Mills, Wister Street and Reading Railway, for the construction of a new power house to be erected at Sixteenth and Hunting Park Avenues, to cost about \$10,000. Contract for building has been awarded to W. E. S. Dyer, Land Title Building, Philadelphia.

SOUTH BETHLEHEM, PA.—Plans have been prepared by the Bethlehem Steel Company for the construction of an addition to its power plant at McAfee, N. J., and also for improvements to the present building.

BALTIMORE, MD.—Contract has been awarded by the Baltimore County Water Company, 100 West Fayette Street, to the Price Construction Company, Maryland Trust Building, Baltimore, for the construction of a new pumping plant to be erected at Falls Road and the Viaduct.

MARLINTON, W. VA.—The erection of a new building at the electric-light and water works plant, to cost about \$6,000, is under consideration.

FREDERICKSBURG, VA.—The contract for the construction of the proposed power plant and laundry building at the State Normal School, Fredericksburg, has been awarded to E. G. Hellin, Fredericksburg. The cost is estimated at about \$20,000.

MANNINGTON, VA.—Plans are being considered by the Rachel Coal Company for the reconstruction of its power house, compressor and ventilation system, recently destroyed by fire, causing a loss of about \$65,000.

NEWPORT NEWS, VA.—The Chesapeake & Potomac Telephone Company has purchased a site in Newport News on which it will erect a new telephone exchange, to cost about \$40,000.

NORFOLK, VA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 10 under specification 3041 for electric-light and power system for shipbuilding slip No. 1 at Norfolk, Va. The cost is estimated at about \$15,000.

RICHMOND, VA.—Plans and specifications are being prepared by the Newport News (Va.) Shipbuilding & Dry Dock Company for the Emergency Fleet Corporation for the construction of a plant to manufacture boilers for all government steamships being constructed along the Atlantic seaboard. The proposed plant, it is understood, will be located on the James River and will include a foundry, machine shop and boiler shop. Electricity will be used for lighting and power. The cost of the work is estimated at \$4,000,000. The Newport News company will have charge of construction of the plant and will operate it for the Emergency Fleet Corporation.

WASHINGTON, D. C.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, D. C., to Skinner & Garrett, 1416 F Street, Washington, for construction of an addition to the Walter Reed Hospital, to cost about \$750,000.

WASHINGTON, D. C.—Estimates of appropriations required by the Engineer Department for the fiscal year ending June 30, 1918, have been submitted to Congress by the Secretary of War, asking for \$1,475,000 for searchlights for defensive purposes, and \$800,000 for sound-ranging equipment.

WASHINGTON, D. C.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, for substitution switchboards to the Carroll Electric Company of Washington, D. C., at \$48,250. Contract has also been awarded to the White City Electric Company of Washington, for an electric lighting system for shipbuilding slip, at \$25,000.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval stations supplies as follows: Eastern and western deliveries, Schedule 1831—dry cells; Schedule 1834—various deliveries of weatherproof sockets; Schedule 1835—various deliveries of rubber and cotton insulating tape; Schedule 1839—for various yards, 68,500 flashlights and 181,000 flashlight batteries. Bids will be re-

ceived until June 11 for furnishing at Washington, D. C., under Schedule 15631₂ & 25 instruction radio sets. Bids will also be received until June 17 for furnishing at the eastern navy yards under Schedule 4577₂—fifty searchlights. Bids will also be received until June 17 for furnishing at Washington under Schedule 4577₂—243 range and deflector transmitters, 1158 springs and 1270 range and deflector indicators. Further information may be obtained on application to the above bureau.

North Central States

CHEBOYGAN, MICH.—The Cheboygan Electric Light & Power Company has awarded contract for the construction of its new power house at the Black River dam to William Moody.

CHILLICOTHE, OHIO.—Application has been made by the Chillicothe & Camp Sherman Electric Railway Company to the Public Utilities Commission for permission to issue \$225,000 in capital stock and \$150,000 in bonds, the proceeds to be used for the construction of the proposed electric railway from Chillicothe to Camp Sherman. George A. Vaughters of Chillicothe is interested.

COLUMBUS, OHIO.—The Frankenburg Construction Company has been awarded the contract for construction of an addition to the power house at the Smith Agricultural Chemical Company.

FREMONT, OHIO.—The City Council is considering the installation of a municipal gas and electric-light plant to be operated in conjunction with the water-works system.

MIDDLETOWN, OHIO.—The Hamilton Electric Company submitted the lowest bid (\$2,800) for lighting the viaduct between Middletown and West Middletown.

LEXINGTON, KY.—The Elkhorn Coal Company, recently incorporated at Lexington, has acquired the property of the Detroit Elk Coal Company and has increased the capital stock from \$100,000 to \$600,000. The company holds many acres of valuable timber and coal lands in Kentucky. Development, it is reported, will begin at once with the establishment of electric plants, telephone and telegraphic service and the building of several towns. A. F. West, C. C. Winters, A. L. Mancourt and John Koenig of Detroit, Mich., are interested in the project.

SERGEANT, KY.—The Whitley-Elkhorn Coal Company is contemplating the installation of electric equipment.

WHITESBURG, KY.—The Elkhorn Superior Block Coal Company is contemplating the installation of new electrical machinery. The capital stock of the company has been increased from \$35,000 to \$100,000.

FRANKLIN, IND.—The Franklin Water, Light & Power Company has petitioned the Public Service Commission for permission to issue bonds to provide for extensions and improvements, etc.

PERU, IND.—The property of the Peru Electric Manufacturing Company has been purchased by Frank Moeck of Peru.

LENA, ILL.—The Public Utilities Commission has approved the contract of the Lena Electric Light & Power Company for the joint use of the transmission lines from Lena to Lanark and the lines of the Pearl City Independent Telephone Company, the Stephenson County Telephone Company and the Pearl City Mutual Telephone Company at Pearl City.

ROCKFORD, ILL.—A new special committee, consisting of Aldermen Clothier, Ogren, Murphy, Croon and Johnson, has been appointed by Mayor Rew to investigate the proposition of establishing a municipal electric-light and power plant in Rockford.

WOODSTOCK, ILL.—The Woodstock Typewriter Company, North Dearborn Street, Chicago, is planning to build a power plant at its works in Woodstock, to cost about \$10,000.

MILWAUKEE, WIS.—Contract has been awarded by the Lavine Gear Company of Racine to the Dahlman Construction Company of Milwaukee for the construction of a new machine shop and manufacturing plant, 175 ft. by 275 ft., at Keefe Avenue and North Pierce Street, Milwaukee. The cost of the building with equipment is estimated at \$350,000.

ROCKDALE, WIS.—The Village Council has granted the Cambridge (Wis.) Electric Light & Power Company a franchise to construct and operate an electric-light and power system in Rockdale.

MUSCATINE, IOWA.—The City Council is considering the question of establishing a municipal electric-lighting plant.

NEOLA, IOWA.—Bonds to the amount of \$10,000 have been voted for improvements

to the municipal electric-light plant and water-works system.

ADRIAN, MO.—A special election will be held on June 11 to submit to the voters the proposal to grant an electric-light franchise to Mr. Green.

CAMERON, MO.—The installation of a forced draft system in the municipal electric power plant is under consideration by the electric light committee.

JOPLIN, MO.—The Bankers' Mining Company of Joplin is contemplating the installation of new machinery in its concentrating plant, to cost about \$25,000.

KANSAS CITY, MO.—Plans are being considered by the A. Holtman Heating Company for rebuilding its plant, recently destroyed by fire. The cost of the proposed new plant is estimated at about \$90,000. Smith, Rea & Lovitt of Kansas City are architects.

ST. LOUIS, MO.—The capital stock of the Union Electric Light & Power Company has been increased from \$21,240,000 to \$22,240,000. The company, it is understood, contemplates improvements to its system.

MILLER, S. D.—Bids will be received by the city auditor, Miller, S. D., until June 17 for additions and improvements to the municipal electric-light plant as follows: (1) Concrete addition to building; (2) an 80,000-gal. steel tank on a 100-ft. steel tower; (3) a 50,000-gal. reinforced concrete reservoir; (4) furnishing and erecting two 72-in. by 16-ft. fire-tube boilers, a 100-ft. concrete chimney, one 75-kw. and one 100-kw., 2300-volt steam engine-driven generating unit, switchboard, two 200-gal. per minute motor-driven centrifugal pumps, steam piping connections and some miscellaneous water and sewer connections; (5) for furnishing and erecting materials for reconstruction of existing alternating-current pole line distribution system in Miller. Plans and specifications may be obtained upon application to Earle D. Jackson, Capital Bank Building, St. Paul, Minn., upon deposit of \$10. Plans are on file at the office of the city auditor, Miller.

CEDAR, KAN.—The Solomon Valley Power Company of Downs, it is reported, contemplates some changes in its local wiring system.

CHENEY, KAN.—At an election held recently bonds to the amount of \$15,000 were voted, the proceeds to be used to purchase the local electric-lighting plant and for improvements to same.

LARNED, KAN.—Arrangements have been made between the City Council and Nathan L. Jones whereby the latter will purchase the surplus energy from the municipal electric plant. Mr. Jones and associates are planning to erect an electric transmission line up the Pawnee Valley, and from the station of Frizell south to Garfield to connect with a line just completed by Mr. Jones from the line extending to Lewis and Belpre from the plant at Kinsley. Application has been made for a charter for the company.

WELLSVILLE, KAN.—C. A. Smith, owner of the local electric-light plant, has applied for permission to erect an electric transmission line to supply electricity in the towns of Garfield and Edgerton.

Southern States

ATLANTA, GA.—An election will be held on July 10 to submit to the voters the proposal to issue \$75,000 in bonds for the installation of an electric generating plant.

BRUNSWICK, GA.—The City Council is considering taking over the water plant of the Mutual Light & Water Company, to be owned and operated by the municipality.

DAVISBORO, GA.—Contract has been awarded by the City Council for the construction of an electric-light plant. The initial installation will provide sufficient electricity to light the streets and business houses. Later an addition will be made to furnish electrical service for domestic purposes. The plant will be driven by a gasoline engine.

BRISTOL, TENN.—The Waggoner, Phillips, Barnes Company, care of the Bristol Ice Company, would like to receive prices, catalogs, etc., on ice-manufacturing machinery, etc.

NASHVILLE, TENN.—Messrs. Morgan & Hamilton of Nashville are erecting an addition to its plant, which will be equipped with motor-driven machinery. The company manufactures bags.

MENA, ARK.—The local electric-light plant, owned by Tomlinson Brothers, has been purchased by the Commonwealth Public Service of Muskogee, Okla., at \$24,200. The company also purchased the property of the Mena Ice & Cold Storage Company.

A new electric franchise, it is understood, will be asked by the new company.

RISSON, ARK.—The Fordyce (Ark.) Light & Water Company has been granted a franchise to construct and operate a waterworks system in Risson.

POTEAU, OKLA.—The Citizens' Consolidated Power & Electric Company, recently organized, has petitioned the city of Poteau for a franchise to install and operate an electric plant.

BRYAN, TEX.—Material has been ordered for the erection of an electric transmission line from the city limits to the clubhouse and grounds of the Fin-Feather Club, south of the city.

Pacific and Mountain States

BELLINGHAM, WASH.—Plans are being considered by the Boundary Red Mountain Mining Company of Bellingham for replacing its power plant destroyed by fire last winter. It is proposed to install a much larger plant.

CHEHALIS, WASH.—G. O. Anderson has filed a petition with the City Commission for the resubmission of the Anderson franchise for furnishing electricity for lamps and motors in Chehalis to the voters. The franchise was rejected at the election held April 20. Resubmission is asked on account of technical irregularities in the election.

EVERETT, WASH.—Bids are being asked by the United Steel Company for the erection of buildings for its plant. The main building is to be 70 ft. by 200 ft. The company proposes to install two reheat furnaces and an electric furnace. The equipment will also include two large magnets operated by electricity for handling scrap.

NEWPORT, WASH.—A large transformer in the local substation of the Washington Water Power Company was recently destroyed by fire, causing a loss of about \$3,000.

OKANOGAN, WASH.—The Okanogan Valley Power Company is contemplating the erection of an electric transmission line between Riverside and Tonasket during the summer.

SEATTLE, WASH.—The Rothert Process Steel Company, 622 Harrison Street, is planning to install a 10-ton electric furnace at its plant in connection with other extensions.

SEATTLE, WASH.—The City Council has passed over the veto of the Mayor a bill granting the National District Telegraph Company a franchise to install a signal alarm system in Seattle.

SEATTLE, WASH.—The War Department has awarded contract to the Aero Alarm Company of Seattle for equipping 2000 hospital buildings in camps and cantonments with aero apparatus.

SEATTLE, WASH.—The City Council has passed an ordinance placing the sealing operations on the basin of the new Cedar River dam under joint supervision of J. D. Ross, superintendent of lighting, and L. B. Young, superintendent of the water department.

SEATTLE, WASH.—The City Council has passed the ordinance providing for the development of a hydroelectric power plant on the Skagit River and for the issuance of \$5,500,000 in bonds to cover the cost of the work. The additional \$500,000 was suggested by A. H. Dimmock, city engineer, and J. D. Ross, superintendent of lighting, as the original bids did not include the cost of the city substation.

SPOKANE, WASH.—The Spokane Heat, Light & Power Company will not extend its lines into the residential district this year as had been announced. In view of the government's request to curtail all unnecessary extensions in all lines of business, no new patrons will be sought by the company.

VANCOUVER, WASH.—Bids will be received by the Columbia River Interstate Bridge Commission, Vancouver, until June 28, for furnishing material and construction of a transformer house on Washington Street, Vancouver. Plans may be secured at the office of the clerk of Multnomah County at Portland, Ore., or the county auditor of Clarke County at Vancouver.

KLAMATH FALLS, ORE.—The Keno (Ore.) Power Company has submitted a tentative proposal to the city of Klamath Falls offering to sell its plant at Keno to the city to be owned and operated by the municipality. The company was granted a franchise to operate in the city over a year ago.

PORTLAND, ORE.—A permit has been granted to the Northwestern Electric Company for the erection of a power plant at the foot of Lincoln Street, to cost about

\$250,000. Charles C. Moore & Company are engineers.

ANGELES CAMP, CAL.—Work has begun on unwatering the Pioneer Mine at Angeles Camp. Electricity will be used to operate the machinery in the mine. The company has already taken over the transmission line of the Brown-Smyth-Ryland Company adjoining, together with transformers, etc.

CHOWCHILLA, CAL.—Contract has been awarded by George R. Perry for the construction of a machine shop, 350 ft. by 100 ft., to James Daly, of Fresno. It will be equipped for automobile and tractor engine construction and repairs, with overhead cranes, etc.

FRESNO, CAL.—Rosenburg Brothers & Company, 706 G Street, Fresno, have awarded contract for the construction of a new packing plant to the Clinton Construction Company, Townsend Street, San Francisco. The plans provide for the erection of a power plant, 15 ft. by 85 ft. The cost of the entire plant is estimated at about \$200,000.

JACKSON, CAL.—Plans are being considered by the Gage Mining Company, located near Shawmut, for equipping the machinery in its mines for electrical operation. Electricity will be supplied by the Sierra & San Francisco Power Company of San Francisco.

LOMPOC, CAL.—The Lompoc Light & Power Company is contemplating improvements to its plant and distributing system, involving an expenditure of between \$5,000 and \$10,000.

LOS ANGELES, CAL.—Preparations are being made by the Pacific Electric Railway Company for the construction of an electric substation, 32 ft. by 50 ft., to be located at Slauson Junction, Slauson and Long Beach Avenues.

LOS ANGELES, CAL.—Plans have been prepared by the General Petroleum Company, Higgins Building, for the erection of a new machine shop, 40 ft. by 100 ft., one story high.

LOS ANGELES, CAL.—The Water Department is considering equipping four of the waterworks pumping plants for electrical operation. The plants to be operated by electricity are located at Wilmington, Edendale and Garvanza. William Mulholland is chief engineer in the water department.

REDDING, CAL.—The California-Oregon Power Company is planning to erect a high-tension transmission line from its southern terminus at Castella to Kennett, at a cost of about \$330,000, and to furnish electricity to the Mammoth mine and smelter for a minimum of \$105,000 per year. The Northern California Power Company of San Francisco, it is said, will reinforce its transmission line from the Coleman power house to Hamilton, at a cost of \$110,000, and deliver energy at Colusa to the Pacific Gas & Electric Company. Improvements, involving an expenditure of about \$3,000,000, are contemplated by the three companies.

SAN PEDRO, CAL.—Extensive additions are being made to the plant of the Southwestern Shipbuilding Company, located south of Fish Harbor Wharf, which will include the erection of a transformer station, 20 ft. by 27 ft.

SANTA BARBARA, CAL.—The City Council has adopted a resolution authorizing the installation of an ornamental lighting system on Chapel Street from Ocean Boulevard to Gutierrez Street.

SANTA BARBARA, CAL.—The City Council has granted the Santa Barbara Telephone Company a franchise to erect and maintain pole lines, etc., and to lay underground conductors for wires on and under the streets, alleys and avenues in Santa Barbara.

TORRANCE, CAL.—The Pacific Electric Railway of Los Angeles has awarded contract to the Wurster Construction Company, Central Avenue, Los Angeles, for the construction of its new shops at Torrance as follows: Car works, 180 ft. by 150 ft.; force shop, 150 ft. by 200 ft.; erecting shops, 180 ft. by 450 ft.; paint shop, 180 ft. by 450 ft.; power plant, 60 ft. by 120 ft., and other structures. The cost of the entire works is estimated at \$1,000,000.

WINTERHAVEN, CAL.—The Board of Supervisors has granted the Winterhaven Improvement Company a franchise to construct and operate an electric-light and power plant, waterworks and gas plant in Winterhaven.

BOISE, IDAHO.—The Public Utilities Commission has granted the Idaho Power Company permission to cancel its air-heating contracts in Twin County, contracts to be abrogated at once, except in hospitals and homes where there is sickness. The heavy load on the Shoshone plant since the

opening of the irrigation season has made the cancellation of the contracts necessary.

BEAVER, UTAH.—The Beaver River Power Company is contemplating extending its electric transmission line to the sulphur mine near Cove Front, northeast of Milford.

SALT LAKE CITY, UTAH.—The lighting and heating plant, laundry, engine room and part of the nurses' quarters at the St. Mark Hospital were recently damaged by fire.

SALT LAKE CITY, UTAH.—The County Commissioners have authorized the county attorney to draw up a contract with the Utah Power & Light Company for the installation of 98 lamp posts on the Redwood Road and 177 on State Street.

SOLIGMAN, ARIZ.—Surveys have been made for a large hydroelectric development on the Colorado River north of Soligman. E. L. Boyard of Soligman may be able to give further information.

SACO, MONT.—Arrangements are being made by D. T. Gilbert, owner of the local electric-light plant, for extensions and improvements to his plant.

MINA, NEV.—The installation of new electric machinery in the new 100-ton concentrating plant to be erected at the Gunmetal tungsten mine, about 2 miles from Mina, is under consideration.

PALISADE, NEV.—The installation of considerable new electric machinery in connection with the construction of a new large concentrating plant is under consideration by the Union Mines Company.

TONOPAH, NEV.—Work has begun on the erection of the new Tonopah-Gold Mountain transmission line of the Nevada-California Power Company. The proposed line will be extended from the Jim Butler mine to the property of the Tonopah Divide Company and other Gold Mountain companies.

DEMING, N. M.—The Deming Ice & Electric Company is contemplating the installation of new machinery at its plant.

Canada

VANCOUVER, B. C.—Mundy, Rowland & Company of Vancouver have been awarded the contract for the electrical work on the Manitoba Parliament Buildings at Winnipeg, amounting to more than \$100,000. The company has also secured the contract for the electrical installation in the Saskatchewan Co-operative Hospital at Port Arthur, Ont., at \$25,000.

HAMILTON, ONT.—Tenders will be received by Charles G. Booker, Mayor, addressed to S. H. Kent, city clerk, Hamilton, until June 17 for furnishing and installing two 200-hp. water-tube boilers or one 400-hp. water-tube boiler. Specifications and form of tender may be obtained at the office of the engineer.

DRUMMONDVILLE, QUE.—The Southern Canada Power Company has awarded contract for the construction of a dam and concrete power house on the St. Francis River, near Drummondville, to Morrow & Beatty of Peterboro, Ont. The company is planning for a development of 10,000 hp. at present, but will make provision in the power house for an ultimate development of 18,000 hp.

HULL, QUE.—The Hull Electric Company is considering making extensions to its system.

MONTREAL, QUE.—The contract for rebuilding the hydroelectric plant for the College de Montfort, including a concrete dam, a wooden-stave pipe line and a brick and concrete power house, has been awarded to Arsenault & Plamondon, Ltd., of Montreal.

SHAWINIGAN FALLS, QUE.—Work, it is reported, will soon begin on the construction of a new plant for the Canadian Ferro-Alloys Company, to cost about \$100,000.

LLOYDMINSTER, SASK.—The installation of an electric-lighting plant, to cost about \$60,000, is under consideration by William and E. Johnson of Lloydminster.

Miscellaneous

MANILA, P. I.—Arrangements are being made by the Manila Electric Railway Light Company for extensions to its plant. New equipment, including a 1000-kw. turbine and a 10,000-sq. ft. building, one 1000-kw. rotary, one 1000-kw. exciter, switchboard, etc., has been purchased from the Westinghouse Electric & Manufacturing Company. The cost of the plant, including the cost of the land, is estimated at \$1,000,000. The company is also planning to install a new steam boiler and induced-draft fans.

(Issued May 7, 1918.)

Record of Electrical Patents

Notes on United States Patents

1,265,744—Wall Box for Electrical Apparatus

- 1,265,716. MEASURED-SERVICE TELEPHONE SYSTEM; George A. Yanochowski, Chicago, Ill. App. filed Feb. 4, 1914. A simplified cord circuit for use in semi-automatic systems.

(Issued May 14, 1918.)

- 1,265,728. TELEGRAPH SYSTEM; John H. Bell, East Orange, N. J. App. filed July 12, 1917. Reproduces signals in the form of a printed record.
- 1,265,744. WALL BOX FOR ELECTRICAL APPARATUS; Clair C. Canfield, Crafton, Pa. App. filed April 6, 1915. Improvements.
- 1,265,749. SIGNAL BOX WITH LOCAL ALARM MECHANISM; Frederick W. Cole, Newton, Mass. App. filed May 10, 1915. Box having a normally unwound signaling mechanism.
- 1,265,751. SIGNALING SYSTEM; Roy D. Conway, Chatham, N. J. App. filed July 9, 1917. Signaling on composite telegraph and telephone circuits.
- 1,265,765. ELECTROTHERMOSTATIC DEVICE; Harry A. Ferris, Cheyenne, Wyo. App. filed March 2, 1917. Devices for shifting valves or the like, etc.
- 1,265,820. FLASHLIGHT; Edward W. Seymour, New York, N. Y. App. filed April 10, 1917. Pocket lamp.
- 1,265,829. ELECTRIC RAILWAY SYSTEM; Kenneth E. Stuart, Philadelphia, Pa. App. filed Aug. 29, 1914. For electric railway system where the motor cars are automatically controlled.
- 1,265,830. POLARIZED REPEATING SOUNDER; Adolph Swoboda, Montclair, N. J. App. filed Sept. 13, 1915. Telegraph sounders.
- 1,265,849. ELECTRIC WATER HEATER; Jesse F. Wheelock, Dobbins, Cal. App. filed May 19, 1914. Improvements.
- 1,265,851. MECHANISM FOR INSTALLING TRANSMISSION-LINE WIRES; Harry C. Williams, Irvington, N. J. App. filed Nov. 2, 1917. Improvements.
- 1,265,873. BRUSH MOUNT FOR ELECTRIC MOTORS; Joseph Berg, Chicago, Ill. App. filed Jan. 27, 1917. Improvements.
- 1,265,875. PIPE CONNECTION; Carl H. Bissel, Syracuse, N. Y. App. filed June 2, 1913. Pipe connection for electrical conduits and service boxes.
- 1,265,879. COMBINATION TERMINAL AND FIXTURE BOX; David Byrne, Toledo, Ohio. App. filed July 30, 1917. Provides a means whereby a terminal box or plate can be formed into a fixture box or plate.
- 1,265,884. ELECTRIC REGULATION; John L. Creveling, New York, N. Y. App. filed Sept. 29, 1911. Automatically regulating

dynamo when used to charge a storage battery.

- 1,265,885. LIGHTING FIXTURE; David Crownfield, Cambridge, Mass. App. filed Dec. 4, 1916. Lighting fixture for use on the walls of a hospital ward.
- 1,265,887. TELEGRAPH KEY; Benjamin de Alcala, New Orleans, La. App. filed March 6, 1917. A telegraph key which automatically completes the circuit.
- 1,265,911. MULTIPLE-FRICTION-DISK DEVICE; Clark T. Henderson, Milwaukee, Wis. App. filed Feb. 1, 1913. Improvements that provide for the ventilation of the disks, etc.
- 1,265,918. CIRCUIT BREAKER AND DISTRIBUTER UNIT; William O. Kennington, Detroit, Mich. App. filed April 14, 1916. For ignition apparatus.
- 1,265,927. HEAT-REGULATING SYSTEM; Harry Lewis, William R. Scott and Charles Dell, Pittsburgh, Pa. App. filed June 1, 1916. Involves use of a thermostat and a valve with an electromagnet.
- 1,265,945. ELECTRIC FURNACE; Hans Nathusius, Friedenshutte, Kreis Beuthen, Germany. App. filed Jan. 15, 1914. Heated by means of electric resistances.
- 1,265,959. ROTARY SPARK GAP; Robert C. Richter, New York, N. Y. App. filed April 13, 1917. Spark gaps used in radio communication.
- 1,265,973. ELECTRIC ZINC-DISTILLING FURNACE AND CONDENSER; John Thomson, New York, N. Y. App. filed Jan. 19, 1916. Furnaces and condensers for the metallurgy of zinc.
- 1,265,998. METERING PANEL; Henry H. Curtis, Springfield, Mass. App. filed April 6, 1917. Assembles blocks or sections of insulating material.
- 1,266,006. CABLE CONSTRUCTION; Henry W. Fisher, Huguenot Park, N. Y. App. filed July 10, 1916. Method used in construction of a multiple-conductor cable.
- 1,266,057. ELECTRIC BRAKE DEVICE; Alson C. Sargent Des Moines, Iowa. App. filed Oct. 12, 1915. For automobiles.
- 1,266,062. ELECTRIC MOTOR FOR TALKING MACHINES; Howard A. Selah, Newark, N. J. App. filed Dec. 7, 1915. Direct-current induction motor for operating the turntable of talking machines.
- 1,266,063. MAGNETO; Luther J. Severson, Constantine, Mich. App. filed Aug. 10, 1908. For high-tension ignition system.
- 1,266,094. ELECTRIC WELDING MACHINE; Edmund J. von Henke, Lynn Mass. App. filed May 14, 1917. Embodies a transformer.
- 1,266,095. MULTIPLE FUSE; Louis B. Bennett, Detroit, Mich. App. filed March 26, 1917. Fuses mounted in a screw-plug engage with a socket fitting in the electric circuit.
- 1,266,101. SIGNAL DEVICE FOR AUTOMOBILES; William J. Bunyan, Cleveland, Ohio. App. filed Oct. 12, 1917. Red and blue lights are controlled by a switch.
- 1,266,114. CORD TERMINAL; Arthur E. Francis, Cleveland, Ohio. App. filed Aug. 17, 1917. Connectors adapted for connecting wires with spark plugs of internal-combustion engines.
- 1,266,143. SPRINKLER ELECTRIC SIGNAL SYSTEM; James D. Nelson, Cincinnati, Ohio. App. filed April 19, 1917. For supervising sprinkler system.
- 1,266,114. ELECTRIC SIGNAL SYSTEM; James D. Nelson, Cincinnati, Ohio. App. filed May 5, 1917. For indicating a flow of water through automatic fire extinguisher systems.
- 1,266,150. ELECTRIC SIGNALING SYSTEM FOR RAILWAY TRAINS; Nicholas Pignataro, Hilton, N. J. App. filed Jan. 16, 1914. Safety appliances for railroads.
- 1,266,158. RAILWAY-TRAIN DISPATCHING CIRCUIT; William Reid, Chicago, Ill. App. filed Sept. 8, 1914. Provides a balanced receiving circuit.
- 1,266,166. BATTERY CELL; John C. Sangers, Cleveland, Ohio. App. filed Oct. 15, 1917. Dry-cell type.

- 1,266,175. LIGHTNING PROTECTOR; Nikola Tesla, New York, N. Y. App. filed May 6, 1916. Lightning protectors in which the terminal has a large surface.
- 1,266,180. ELECTRIC CONTROLLER; Herbert S. Valentine, Philadelphia, Pa. App. filed June 30, 1915. Controller finger automatically adjusts itself.
- 1,266,190. CIRCUIT-CHANGING SWITCH; Arthur H. Adams, Sparkill, N. Y. App. filed Dec. 9, 1916. Register controller in automatic telephone systems.
- 1,266,206. ELECTRIC SWITCH; Charles W. Brockett, Brooklyn, N. Y. App. filed June 26, 1916. Key-socket type.
- 1,266,209. ELECTRICAL GROUND; Thomas W. Byrne, Boston, Mass. App. filed March 16, 1917. Ground of carbon, which is non-corrosive.
- 1,266,259. GEARING; Otto Helms, New York, N. Y. App. filed July 27, 1916. Improvements.
- 1,266,287. HIGH-FREQUENCY APPARATUS; Antonio Longoria, Cleveland, Ohio. App. filed Aug. 10, 1914. For therapeutical purposes.
- 1,266,302. DYNAMO-ELECTRIC MACHINE; Alfons H. Neuland, New York, N. Y. App. filed Feb. 10, 1915. Alternators have relatively low angular and peripheral speed; suitable for wireless signaling.
- 1,266,303. ELECTROMAGNETIC POWER-TRANSMITTING APPARATUS; Alfons H. Neuland, San Francisco, Cal. App. filed Aug. 8, 1914. Adapted to transmit power from one rotatable element to another.
- 1,266,329. ELECTRO-OSMOTIC EXTRACTION OF WATER FROM ANIMAL, VEGETABLE AND MINERAL SUBSTANCES; Botho Scherwin, Frankfurt-on-the-Main, Germany. App. filed Nov. 20, 1912. Electro-osmotic process in conjunction with mechanical pressure.
- 1,266,330. PROCESS FOR REMOVING LIQUID FROM STEATITE; Botho Scherwin, Frankfurt-on-the-Main, Germany. App. filed Nov. 11, 1914. Removing of water from steatite by electro-osmosis.
- 1,266,347. ELECTRIC METER; Elihu Thomson, Swampscott, Mass. App. filed April 6, 1916. Direct-current meter of the motor type.
- 1,266,377. CONDENSER; E. F. W. Alexander, Schenectady, N. Y. App. filed Nov. 26, 1915. For the protection of distribution systems.
- 1,266,388. DYNAMO-ELECTRIC MACHINE; Sven R. Bergman, Nahant, Mass. App. filed May 13, 1916. Embodies a distributed compensating winding.
- 1,266,389. AUTOMATIC WIRELESS APPARATUS FOR PREVENTING COLLISIONS; Harry D. Betz, Kansas City, Mo. App. filed Dec. 20, 1913. Wireless apparatus for automatically stopping a railway locomotive.
- 1,266,405. RAILWAY SIGNAL AND TRAIN-STOP SYSTEM; John B. Casselman, Oakland, Cal. App. filed June 29, 1914. Automatic signal system.

1,266,302—Dynamo-Electric Machine

- 1,266,420. SWITCH; William W. Dean, Chicago, Ill. App. filed Nov. 7, 1913. For electric alarms for motorcycles, etc.
- 1,266,421. SIGNALING DEVICE; William W. Dean, Chicago, Ill. App. filed May 18, 1914. For use in connection with automobiles, motorcycles, etc.
- 1,266,424. ELECTRIC SWITCH; Frank C. De Reamer, Schenectady, N. Y. App. filed Dec. 11, 1916. For vacuum cleaners.
- 1,266,434. PROTECTION AGAINST EXCESSIVE VOLTAGES; Hans Engel, Charlottenburg, Germany. App. filed July 14, 1915. For preventing current rushes and excessive voltages when transformers are connected to high-voltage supply circuits.

Electrical World

The consolidation of ELECTRICAL WORLD, ELECTRICAL ENGINEER and AMERICAN ELECTRICIAN

Volume 71

New York, Saturday, June 15, 1918

Number 24

Atlantic City Convention of the N. E. L. A.

SERVICE in its highest, deepest, broadest sense was the nucleus about which the convention activities of the National Electric Light Association at Atlantic City this week concentrated. There was no escape from its spell. Conscious of its ability and power as a creative and directive force in the community and in the nation, this association of public utility interests solemnly pledged its all to the government in the holy cause in which we and our allies are now engaged. Is there, can there be any doubt of the whole-hearted patriotism of the central-station companies of America? Have they not endured suffering and privation in a material and monetary sense at the hands of the government? Have they not been chastened and sorely tried in spirit by the uncertainties and the realities of legislation? And have they not borne all gladly and willingly because it was for the public good? One motive dominates, and one only—service. Selfishness has no place in it. The spirit of sacrifice which animates the American people also animates the electric lighting interests, and while the reward of victory will eventually and surely come to us as a nation, recognition has already in large measure been attained by the electrical industry.

The war has done more for the electrical industry during the past year than all other agencies combined. It would appear as though the nation had discovered electricity anew, so confidently and enthusiastically do the government and the war industries turn to it for the power to fashion and weld the thunderbolts which our brave soldiers hurl at the enemy. We need production of food, ships, munitions and other things to win this war. Time was when the prowess of one human being was matched against that of another, hilt to hilt; but that time has passed. Nation now faces nation, production is matched against production and engineering skill against engineering skill. The final victory will be won "over there," but only because of the production "over here," and the greatest aid to that production is electricity. Therefore, the obligation to supply that electricity is very real, and it is comforting to feel that the central-station interests realize it and that the Fuel Administration stands ready to aid.

We commend to the prayerful consideration of every public utility executive and operator the address of Samuel Insull, delivered at the Thursday night session of the association. From the wealth of his experience with the largest central-station system in the world he spoke authoritatively and reassuringly of the outlook. Naturally he is gratified at the trend of developments and the belated recognition of the economy of concen-

trated power production from superstations. It needs no second taste to detect the seasoning which makes the dish so palatable to American operators. Mr. Insull has been the leading exponent of the central-station industry in that cause and in the welding together of great distribution networks. The striking passages of Mr. Lieb's admirable presidential address also will bear much re-reading, indorsed as they are by the committee to which they were referred and by the association. It would be difficult indeed to find any vital phase of central-station operation that was overlooked in the convention program or on which advice and guidance were not freely given. Certainly the coal situation and the financial situation, the two most pressing problems, were adequately presented and discussed from all angles.

Certain outstanding features of the convention were so apparent that they could not but impress themselves on the consciousness of all in attendance. The necessity for storing coal before the winter and of using it economically was manifest both from the warnings of the Fuel Administration representatives and from the testimony of utility operators themselves. Nor could sight be lost of the fact that electricity must be conserved for war industries and withheld from industries under the ban of the administration. Wider interconnection of generating systems with a view to the saving of money, equipment, coal and transportation, not to mention the increase in the reliability of service, must obtain and may be insisted on if the war is of long duration. The utilities must also, if they are to be kept in condition to render good service, be granted an increase in rates. On their part they must husband all their financial resources, curtail extensions and endeavor to arrange their financial affairs without much assistance from the government. Certain economies are possible in power-house operation and in distribution circuits, and these should be effected as speedily as possible for patriotic as well as for selfish reasons. Maximum output and use must be found for all apparatus, labor must be spared, and attention given to the substitution of female for male help in various departments. Opportunities in the electric vehicle field for relieving transportation congestion and for hastening distribution in industrial plants should not be overlooked by central-station companies in their endeavor to measure up to their enlarged standards of service in helping to win the war.

With due consideration and study of these important points in a broad and patriotic spirit there can be no doubt as to the ultimate outcome. The central-station industry is destined to go forward; the war has pushed it on, and under that impetus it can outrun all calculations if those in charge will it so.

Interconnection Does Not Mean Monopoly

AS THE interconnection of central-station and transmission systems develops into a general network of energy supply, it is important for the local publics concerned to realize that such a program is primarily an efficiency measure. War accelerates negotiations between interests which in peace times might work for years with little or no physical co-ordination. The necessity for accomplishing results at lower unit cost is enormously increased as a nation of highly complex industrial organization goes deeper and deeper into the conflict. Hence many steps are taken to meet acute national needs which in normal times could not be carried out except at the price of protracted public discussion, prolonged negotiations and often needless delays. The emergency nature of many things done under the stress of war conditions, however, should not prevent utility managements from clearly setting forth their economic benefits, their patriotic value and their freedom from ulterior motives.

We say this because there is a feeling in some quarters that interconnection of electric systems is being furthered chiefly that a monopolistic control of distribution may be established. Even in the minds of some public utility commissioners there exists an opinion that interconnection is a camouflage for absorption. As a practical matter, interconnection is fundamentally a give-and-take affair, worked out in relation to such technical variables as local loads, available generating capacity, size of conductors on lines, installed transformer ratings, stages of water in streams and reservoirs, duration and extent of demands, location of demands, and cost of fuel, labor and unit power, whether primary or secondary. In a well-worked-out plan energy may be fed in one direction to-day and in the opposite direction to-morrow, or such a reversal may occur during a single twenty-four-hour period. By and large, the idea is simply to generate, transmit and distribute energy at specified points at the lowest attainable cost, conserving fuel, labor, water, supplies and capital outlay as well to the utmost consistent with first-quality service.

Given a workable agreement among the parties to an interconnection scheme, the question of ownership is really no test of its value. There may be, of course, a monopolistic intent behind any co-operative plan, but the fact that co-ordination of agencies is sought is no indication of it. Team play in energy interchange between adjacent utilities is primarily an economic affair; it should be judged according to the engineering and commercial benefits which it insures, and not by the possibility of abuse arising from community of interest.

There are plenty of ways in which the public welfare can be safeguarded against exploitation; in fact, the publicity necessary to-day before utilities may formally unite and issue securities therefor with the approval of a public regulating board leaves little to fear from the advance of the usual interconnection scheme. Early setting forth in each case of the benefits to all interests from such a program will go a long way to disarm ill-advised criticism and to convince the public and the service commissions which protect its interests that the plan is a praiseworthy one.

Interconnecting New England Power Stations

THE shortage of coal in New England during the past season has been a very serious matter, affecting generating stations all over the territory, and the situation threatens to be little if any better during the coming season. The warning has already gone out that trouble in transportation is to be looked for. Particularly pertinent therefore at the present time is the study of interconnecting plans for New England stations developed by L. L. Elden, the accomplished engineer of the Boston Edison company, embodied in an address before the New England Central Station Power Engineers' Association and noticed in an article in our issue for June 8. In brief, he estimates that within the New England territory interconnections can be made at a cost of about \$2,750,000 which would be sufficient to release 50,000 kw. in equipment for additional service. New England is, on the whole, covered by power distribution systems, but they have not been as yet skillfully interconnected as a whole. The Boston Edison company gathers between 400 and 500 square miles (from 100,000 to 130,000 hectares) into its distribution territory. South of Boston, running all the way down to Fall River, are other systems, each covering its own district but not working in co-operation. To the northward lie plants along and near the coast as far as Portsmouth, N. H., and inland to Lowell, Mass., and Manchester and Concord, N. H., all with more or less scattered service and yet not gaining the advantages of unity.

Westward there is another great territory, in part reached by the hydroelectric system of the New England Power Company, with stations on the Connecticut and Deerfield Rivers. Plans are now under way for bringing this power into Boston; it already reaches Fitchburg, Worcester and Providence, as well as some nearer points. Mr. Elden's proposition looks to a thorough linkage of all these distribution networks so that the aggregate capacity of all will be available throughout the whole territory taken in. To the south there is no difficulty in linking the lines so as not only to interconnect them with the Boston Edison company but, without much difficulty, with the New England Power Company as well, providing what amounts to a ring system of distribution. To the northward interconnections with the Edison company are already in force and may be easily extended, while it is no long reach from the northern lines of the New England Power Company to those in the Merrimac Valley and again those in eastern New Hampshire. The practical result would be to gather into one physical entity electric lines serving a territory reaching from Providence and Fall River on the south to Manchester, Concord and Portsmouth on the north, covering, with its connections already existing, the major part of the great manufacturing territory of New England.

Could this be accomplished before winter sets in, as is perfectly possible, the fuel situation would be very much relieved, for most of the deliveries could be then made at various tidewater plants. A considerable number of small stations, relatively inefficient, could be shut down altogether, and Mr. Elden estimates the annual reduction in coal consumption at at least 70,000 tons, no insignificant amount at present prices and with the increasing stress on transportation facilities. It is a

large but particularly sensible project which he has set forth, and if carried out it would be of great benefit to New England territory. The distances to be covered are altogether conservative. There is no need for extreme voltages and no call for any construction of extraordinary difficulty or cost. As to feasible methods of accomplishing such interconnection, the necessary pooling of interests for direct action might not prove to be easy, but the formation of a subsidiary company to attend to the distribution on a fair basis of cost to all the contributing companies ought to be easily within the bounds of possibility and could carry out the work quickly and effectively.

The project outlined as a whole strikes us as being a particularly desirable one, to which very careful attention should be given.

Secrecy in Research for War Purposes

MUCH of research and development work done under the direction of the Council of National Defense is shrouded in deep mystery. Not only are the subjects and the methods of investigation treated as confidential but even the places and the persons doing the work are not supposed to be generally known. It is only natural that the general public should be curious to know what is being done and what results have been achieved, and there is a still more natural desire on the part of various specialists to learn of the difficulties and methods of attack. Thus, electrical engineers at large like to know what special electrical problems are confronting the army and the navy, what is being done to solve them, and who are the trusted ones chosen to do the responsible work.

While the ELECTRICAL WORLD realizes the duty of keeping its readers fully informed up to the minute upon the electrical features of the great war, it also is aware of its higher duty to the country of not giving out information that may help or give comfort to the enemy. In most cases important information is impossible to obtain anyway, but even where an interesting item of confidential war news of an electrical nature has been learned inadvertently through some local worker in the field the editors without hesitation place their duty to the country above that to their readers and withhold such items from publication.

Apparently the great majority of our readers fully appreciate this delicate situation and are satisfied with the general items of news, such as those giving the personnel of the various central administrative committees of the Council of National Defense and of its affiliated bodies. The number of "registered kicks" has been remarkably small and probably does not represent the actual amount of dissatisfaction in the electrical ranks. Chief Engineer A does not understand why Chief En-

gineer B of another company has been appointed chairman of the committee on "electric sparks for the navy," while he, who knows infinitely more about sparks than B, has not even been asked to serve on the committee. He wants to know how little the committee has accomplished so as to have a tangible reason for telling his friends at the club that things are pretty rotten over in the little district between Maryland and Virginia. Also Professor X can hardly believe his ears when he finds out that his colleague, Professor Y, whom he never considered his equal, has had allotted to him some mysterious problem on micro-amperes the nature of which even the president of the institution is not allowed to learn. Now Professor Y walks on the campus with the air of a superior being, while Professor X feels mortified and slighted, almost to the point of doing something which will redound to the benefit of the country on his own hook.

Opinion has been expressed that an extreme secrecy in war research is unnecessary in most cases, because the Germans are ahead of us in the defensive and offensive weapons of modern warfare and in finding substitutes for scarce supplies. But these critics forget that considerable interference with the progress of the work would undoubtedly result were not the problems kept secret. With fires and explosions occurring frequently even in well-guarded munition factories, what chance would an individual scientific investigator have against the destruction of his apparatus and data by malicious persons? Moreover, the enemy must not know when we have solved a problem, nor should he get comfort from the knowledge of our failure or delay in obtaining a solution.

There is another reason for which much of war research must remain secret, and that is to avoid public discussion and controversies that would delay the work. Doing government work secretly and without the benefit of professional criticism is rather unusual and contrary to the spirit of this country, so that we are all the time tempted to "butt in," forgetting the unusual conditions under which the country is laboring and that this is literally the case of "à la guerre comme à la guerre." The war has forced us to be secretive, almost undemocratic, and this change should be one more powerful reason for making a supreme effort that this war shall be the last.

Some of the highest and best representatives of the electrical and other professions have been called into the principal committees that guide the research activities of the numerous workers throughout the country, and this fact alone would be a sufficient safeguard to insure that on the whole the work is being done efficiently and honestly. For the rest, our first duty as specialists is to register our qualifications with the proper governmental agency and to keep ourselves in readiness to do our share if and when called upon.

FROM all appearances a serious fuel situation will exist next winter; therefore every effort should be made to eliminate unnecessary and wasteful uses of electric energy, to improve the efficiency of steam production and utilization, and to procure fuel before the winter rush sets in. What New England industrial plants are doing along these lines will be discussed in a coming issue.

The Coming Issues

Another subject of interest to central-station engineers will treat of the use of iron wire for series lighting circuits, and particular attention will be directed to economic considerations. Other articles scheduled for early appearance will deal with features of construction employed on long-span mountain lines and with the development of search-lamps.

The N. E. L. A. "Win the War" Convention

President Lieb Sounds the Keynote in Stirring Patriotic Address, and Strong War Resolutions Are Passed While Current Problems Are Considered—
W. F. Wells Elected President

WAR conditions touched the attendance at the convention of the National Electric Light Association at the Hotel Traymore, Atlantic City, on Thursday and Friday of this week, but they did not dampen the enthusiasm of the delegates for the country which they serve or lessen the readiness to make every atom of sacrifice to win the war. Under the call of national necessity there was a remarkable concentration of thought, purpose and pledge covering all the resources and wide activities of a great industry. The business done was vital to the utilities. It was an earnest promise of co-operation in every government measure. It was a vigorous assurance of help in every possible way leading to victory.

The Opening Session

When President John W. Lieb let his gavel fall at 9.40 o'clock on Thursday morning for the forty-first convention, the thirty-fourth annual meeting, he looked upon an audience which included many men notable in the industry. Devotion to war-service needs was the keynote from the beginning of the first session.

Following the brief introductory remarks of Mr. Lieb a hearty "welcome to the city" was extended by Mayor Bacharach.

A letter to Mr. Lieb from Thomas A. Edison was read by Secretary T. C. Martin. Mr. Edison, expressing regret that war-service duties made it impossible to be present, wrote:

"I am much pleased to note the active part which the industry is taking in making available to the government the vast resources in men and materials which the central stations have available, and the hearty response which their employees have given to the call for service at the front and in all kinds of co-operation in the war activities of the government."

During the reading of the presidential address W. F. Wells occupied the chair.

Mr. Lieb's address was not only a discussion of the work of the year and a presentation of the large problems of the industry under war conditions; it was also a fine, strongly patriotic outline of our national ideals and unswerving purpose in the war.

"If we take a broad-minded survey of the whole field, and consider all the circumstances and conditions surrounding our national life," said Mr. Lieb, "we must come to the conclusion that what has been accomplished is nothing short of miraculous."

Defining the electrical industry as including electric railway, telephone and telegraph, electric light and power systems, and manufacturers on whose output these enterprises depend, Mr. Lieb said that this important industry employs 920,000 men, represents \$10,750,000,000 invested capital, and annual output of \$2,675,000,000. Of these totals the electric light and power industry represents 125,000 men, \$3,000,000,000 invested capital and annual business of \$575,000,000. This branch of public utility service "has become a prime necessity of our civilization, assuming an importance in our economic structure second only to our great railroad systems."

In regard to linking up the regional systems, Mr. Lieb said: "At the present time there is imperative need that our member companies take an advanced position in this matter, in order that every possible advantage may accrue to the nation and its war necessities from the saving in fuel, in plant capacity, in service reliability, and in economy of operation, that is possible through interconnection, exchange of current, and joint operation between adjoining systems."

In going into general economic conditions, President Lieb said that the higher operating costs and the difficulties of getting corresponding advances in rates present a most serious situation that requires the earnest and urgent consideration of the national government.

Mr. Lieb, however, appealed to "every central-station company in the country to go to the very limit of its

power in meeting the urgent requirements of the government, and to respond in a spirit of patriotism and sacrifice to the needs of the nation."

The coal outlook was discussed exhaustively, Mr. Lieb indicating the concern of managers over the coming winter.

Describing the compliance with fuel conservation movements, Mr. Lieb also spoke of the fact that the advancement of the clock to be operative all the year instead of during a limited spring and summer season would have important economic advantages, and would render available a large additional capacity in power plants to be applied to satisfy the present unsatisfied demand of war industries.

A hope for development of the stupendous national asset in water powers was expressed by Mr. Lieb. After taking up labor conditions the president went more into detail on rate-making problems. He showed them the work of the N. E. L. A. and member companies in the war, giving in addition the data on war contributions printed on this page.

The address of Mr. Lieb was received with great applause, and was referred to a committee consisting of Samuel Insull, Joseph B. McCall and Charles L. Edgar.

In the absence of W. H. Atkins, treasurer, his report was read by Frederick Schmitt.

T. C. Martin presented his annual report as secretary.

After Walter Neumuller had read the report of the membership committee President Lieb called upon the sections.

R. J. McClelland, for the Technical and Hydroelectric Section, appointed a nominating committee.

William Schmidt, Jr., reporting for the Accounting Section, announced the following officers for 1918-19: Chairman, Paul R. Jones; vice-chairman, R. W. Symes; treasurer, C. E. Calder; secretary, Frederick Schmitt.

E. S. Mansfield reported as chairman of the Electric Vehicle Section and appointed a nominating committee.

A brief report was also made by E. A. Edkins, chairman of the Commercial Section, and a nominating committee was similarly appointed.

President Lieb then brought up the work of the geographic sections. A. H. Halloran, who had met with the executive committee, had presented three suggestions which will be referred to a committee to be appointed by the incoming president.

An address by Arthur Wright of London, England, who was in this country recently, on "War by Civilians," was then read by Secretary Martin. Apart from its vigorous remarks on the war, Mr. Wright's address touched on the position of the electrical industry as

MEMBER COMPANIES' WAR CONTRIBUTIONS

Liberty loans:	Amount
First loan—Company purchases of bonds	\$6,567,950
Second loan—Company purchases of bonds	9,552,800
Third loan—Company purchases of bonds	13,134,500
Total	\$29,555,250
	Number
First loan—Employees' purchases of bonds	35,108
Second loan—Employees' purchases of bonds	35,212
Third loan—Employees' purchases of bonds	53,278
Total	123,598
War Saving Stamps, amount sold	\$680,728.91
	Number
Employees engaged in campaign	6,778
Officers utilized in campaign	618
Red Cross subscriptions—company	\$1,095,159.67
Red Cross subscriptions—employees	44,129 372,786.02
Total	\$1,467,945.69

PRESIDENT-ELECT W. F. WELLS

forming a useful illustration of the stimulating effect of war on trade. He said in part:

Electrical power is now recognized as one of the most useful agents in producing the various kinds of war munitions. In most European countries an ever-increasing demand for power has been experienced at much higher costs and rates than in pre-war days. During the last three years in England the tremendous demand for all kinds of manufactured accessories has caused the government to distribute broadcast huge orders for materials and articles among an endless variety of small engineering, woodworking and textile shops with the result that a wholly unexpected demand from them for electrical power, motors, cables, switches, lamps, etc., has occurred.

Unfortunately, the electrical utilities in the early years of the war, owing perhaps to the belief in its probably short duration and to the higher price of money, materials and labor, allowed their active power plant, stocks of materials and standby plant to get into a state of disrepair and low in quantity,

so that when the demand for additional power came in 1916 and 1917 they were unprepared, in many cases, to meet it or began overloading the plant with the usual consequences of frequent breakdowns. Some other electrical industries have not benefited by the war, such as those dealing in expensive lighting fixtures and luxury appliances, yet the manufacturers who have understood the altered conditions have not only benefited greatly by the war demands, but have indirectly materially helped their country.

If public service commissioners can be convinced of the very essential nature of electrical power in war times and made to realize how seriously the present high price of money, plant and labor must affect the cost of producing electrical energy, it surely should not be difficult to obtain their consent to raise the rates to meet these present higher costs. Thus utilities would be assured of a fair return on any existing or new investment required to meet the increased demand for supply during the period of the war and the subsequent years of reconstruction with their multiple problems.

E. W. Lloyd opened discussion on "Line Extensions in War Time." He contrasted the old conditions, under which central stations had optimistically thought it good policy to make line extensions, with present conditions, where inability to raise capital and scarcity of materials and labor have forced a reversal of practice. He urged the appointment of a committee to consider the subject and make recommendations.

Many interesting points were brought out in the dis-

PAST-PRESIDENT J. W. LIEB

cussion, in which W. H. Johnson, T. I. Jones, C. D. Marsh, D. H. McDougall, James T. Hutchings, M. R. Bump, V. E. Bird, L. H. Scherck, H. C. Abell, W. P. Schwabe and J. W. Lieb took part.

Thursday Afternoon Session

Thursday afternoon's session was devoted to reports from three committees—the National Committee on Gas and Electric Service, of which J. W. Lieb is chairman; the National Committee on Public Utility Conditions, P. H. Gadsden chairman, and the public policy committee, W. W. Freeman chairman—and a symposium on labor problems of the hour.

FINANCIAL RELIEF ONLY THROUGH GOVERNMENT

Mr. Gadsden very impressively pointed out the inadequacy of rates to meet present conditions and declared that relief from the existing critical financial condition is only available through the help of the government. Not only are operating expenses higher than ever before, but \$250,000,000 in public utility securities will mature during 1919, and enormous investments are required to provide the increased service demanded by war industries. To provide the additional station and substation equipment alone, nearly \$200,000,000 will be required in 1918. The serious part of the situation is that ordinary channels of financing are not open owing to the war conditions.

Even if the government's help can be secured in meeting maturity of securities and in obtaining money for extensions, however, the fundamental problem still remains—that of securing rates which will permit the companies to exist.

While a few scattered commissions had granted increases of rates to meet war conditions, the committee on public utility conditions thought it could obtain

more prompt relief by securing government action on the matter. By showing that the central station business is the very foundation of war industries and an absolute essential to the prosecution of the war, the committee was successful, through Secretary of the Treasury McAdoo, in securing an expression of opinion from the President of the United States, who said: "It is essential that these utilities should be maintained at their maximum efficiency and that everything reasonably possible should be done with that in view."

With this expression of opinion in hand, the committee has endeavored to open the eyes of the state commissions and local regulatory bodies to the national importance of adjusting rates. To do this, it has appointed committees in every state whose duty it is to call attention of these bodies to the desperate condition of public utilities and to show how intimately their success is connected with the national welfare. It is the hope that this committee can work out the salvation of the industry. Between 600 and 700 rate increases have been allowed since Jan. 1, 1918.

The Investment Bankers' Association thoroughly sympathizes with the committee regarding the situation and has established committees in several Middle West states to assist in bringing about rate adjustments. The American Bankers' Association has also offered its co-operation.

Expressing the opinion of the National Committee on Public Utility Conditions, Mr. Gadsden said that he is firmly convinced that the federal government has the right to fix rates of public utilities that will enable them to exist in time of war. Whether it can be induced to do so remains to be seen.

In trying to obtain relief from the War Finance Corporation for financing new extensions, the committee was greatly discouraged by the corporation's decision that it could not give relief and that help would have

SECRETARY T. C. MARTIN

VICE-PRESIDENT BALLARD

to be secured through banking channels, despite the fact that the committee had already tried this and every other obvious course. Ever since this decision the committee has been making further efforts.

Mr. Gadsden referred to the remarks of Mr. Warburg, Federal Reserve Bank, who emphasized the nation's need of investors' savings, saying that these cannot be obtained unless corporations be placed on a financially successful basis. In closing the speaker invited the hearty co-operation of all in the industry in finding relief from the problems named.

In presenting the report of the National Committee

on Gas and Electric Service, J. W. Lieb called attention to various problems which this committee has helped the government in solving. Among them were the following: Service to cantonments, fuel supply, curtailment of lighting, coal zoning system, oil conservation, power supply, enabling coastwise ships and navy to travel through danger zones without being detected by the smoke from their stacks, night lighting, and shortage of equipment.

INDORSEMENT OF PRESIDENT LIEB'S ADDRESS

Samuel Insull, chairman of the committee to which President Lieb's address was referred, made a report

TREASURER F. W. SMITH

P. H. GADSDEN

expressing high appreciation of the views which it contained.

"The address," said Mr. Insull on behalf of the committee, "with singular clearness and in the broadest spirit reflects the attitude of the association and its members toward the great problems which are confronting our country at this crisis in the world's history.

"It is clearly our duty, as he so admirably indicates, to use every possible human effort, to make every sacrifice and to devote our time to the supreme business of the moment—the winning of the war, to the successful conclusion of which every true American should be pledged."

The committee on the president's address presented the resolution published on page 1252 of this issue, which was adopted with great enthusiasm.

PUBLIC POLICY COMMITTEE

W. W. Freeman, chairman public policy committee, presented a report showing that the first year of war produced many results of radical character affecting company operations. Cost of every element entering into service increased in startling degree, and there was correspondingly increased difficulty in securing satisfactory quality in materials and workmanship. The labor problem has been unavoidably complicated by enlistment and conscription and further government requirements.

"With all of these war operations, we are in the heartiest accord and willingly accept the difficulties which they necessarily involve."

It must be evident, however, says the report, that when operating costs increase enormously, there must be a corresponding increase in income if service is to be maintained and financial stability insured.

Consideration of increased rates for service has become a matter of necessity to member companies. The

rate of return allowed to the companies has been far below the profits realized and approved for other commercial enterprises and generally no margin of safety has been allowed for fluctuation in expenses or unusual contingencies.

"The utilities companies do not ask or desire war profits," the report says. "They are, however, amenable to the same axiomatic laws as other lines of business and cannot alter the rules of arithmetic in their favor or make their dollars go any further in paying bills than can others. This merely means that rates absolutely must be increased, as necessary, to meet new conditions."

Conservation of capital was also considered. Hearty and vigorous co-operation of member companies in every effort and campaign with relation to the war was recognized as a noteworthy activity of the year.

In the concluding section the committee said:

"We are absolutely united in the idea that all other interests and considerations must be secondary to the quickest possible winning of the war, and the victory of the Allies must be complete and final, no matter how long it takes or how much it costs."

Friday Morning Session

Flag Day exercises, with bugle, the reading of "The American's Creed" by Secretary Martin and the unfurling of the flag opened the Friday morning session.

President Lieb announced the appointment of a committee on line extensions as recommended by E. W. Lloyd on Thursday. The committee is: E. W. Lloyd, chairman; R. S. Hale, Alex Dow, H. C. Abell and M. R. Bump.

Herbert A. Wagner then made a general presentation

PAST-PRESIDENT H. A. WAGNER

of "The Coal Situation as Affecting Public Utilities." This opened a broad discussion covering many phases of the coal problem.

Mr. Wagner emphasized the seriousness of the coal situation and reviewed the figures of estimated production and demand for consumption this year. He called attention to the need of coal for shipping and the navy, comprising the first demand to which everything else must give way, and to the requirements for war industries. The points brought out by Mr. Noyes and Mr. Insull in the addresses of Thursday evening were also summarized by Mr. Wagner.

As the primary question is not one of coal production but one of coal transportation and it is not expected that transportation conditions will be improved it is necessary to look to methods of conservation and greater economy. Much emphasis was placed by Mr. Wagner upon the importance of storing coal during the summer months.

The need of conserving energy and the waste of carbon lamps were urged by Mr. Wagner.

In concluding, the speaker called attention to the laws against discrimination between consumers and to the necessity that the federal or state officials give authority to the companies to withhold energy supply from some customers when it is decided by the government that this step is required as a war measure.

At this point a nominating committee was appointed, with J. B. McCall as chairman.

REPORT ON RESUSCITATION FROM SHOCK

Before proceeding with the discussion on the coal situation President Lieb introduced W. C. L. Eglin, who presented the report of the committee on safety rules and accident prevention and of the new Commission on Resuscitation from Shock.

The committee on safety rules and accident prevention included what was formerly known as the accident prevention committee. It was organized with a separate sub-committee on accident prevention with Charles B. Scott as chairman. The activities of the main committee have been somewhat restricted during the year, but the sub-committee on accident prevention has held meetings periodically as it was felt that work of this character should proceed in so far as possible undisturbed and that active and diligent work on the part of safety departments and others was necessary when the man power of the industry and the nation must be conserved to the fullest extent.

In reference to circular No. 54 of the Bureau of Standards Mr. Eglin said that in view of the situation confronting all utilities it was deemed advisable to present the status of affairs to the Bureau of Standards. A conference was held and the general understanding arrived at was to the effect that the Bureau of Standards would, where regulatory bodies raised the question as to the promulgation of rules, continue to emphasize the desirability of any such rules conforming to those in Circular 54 and that they were to be clearly indicated as tentative and subject to a trial period.

In view of the great importance of the report of the Commission on Resuscitation from Shock and of keeping members informed at once as to the best methods, President Lieb recommended that when an interim report reaches headquarters it be sent to members. This was ordered.

COAL CONSERVATION

Philip Torchio discussed the subject of utilization of water powers as a means of coal conservation. Mr. Torchio spoke separately of the potential water powers of Eastern and Western States and emphasized that the amount of water power east of the Rocky Mountains is insignificant in proportion to the energy required by the nation. Even now in the East the water powers are an insignificant factor for supplying the B.t.u. units needed by the Eastern States. Therefore the future must depend on science to provide B.t.u.

units by economizing in the use of coal. In the meantime water powers answer a useful purpose in retarding the days of coal exhaustion. The steam plant must be the backbone of the development in the Eastern States. The use of the water powers should be concurrent with steam utilization.

George A. Orrok referred to the conditions in the anthracite districts, the available fuel in the culm banks and the possibilities of pumping coal by construction of pipe lines.

W. F. Wells discussed the question of whether it was desirable for central station companies to purchase coal mines at this time. He spoke of the experiences of several companies and gave some details of the

CARRY THE WAR TO VICTORY

Resolved, that the National Electric Light Association, in annual convention assembled, desires to extend to the President of the United States and all others in authority the assurance that in its organization and its membership it is in thorough accord with the fixed determination of the American people and their chosen representatives to prosecute the war with the utmost vigor and to a victorious conclusion, however long it may take and however much it may cost in men, money and other forms of sacrifice.

The goal we seek through the prosecution of the war is the winning of a great peace—a peace so well established that it cannot lightly be disturbed by autocratic force wedded to the doctrine that might makes right. For such an end of the war we are ready cheerfully to submit to such further restrictions of personal and corporate activities and to such further burdens upon private and corporate property and business as may be found necessary to impose upon the people and industries of the country.

We recognize as the one great menace of the future the possibility of an inconclusive peace—an armed truce which would inevitably end in a renewal of the unspeakable horrors of the present war. That must not be, and the only way to prevent it is to carry this war to victory—a victory so complete and overwhelming that the forces of evil will be glad to accept such terms as an outraged world may be willing in justice to accord. No compromise, no half-way measures, no patched-up "scraps of paper," can accomplish this great end; but only the devotion, the patience, the self-sacrifice and the undying patriotism of our people and their great allies.

With a realizing sense of the stupendous sacrifices involved, but with an abiding faith in the ultimate result, we pledge all that we have and all that we are to the holy cause.

views of the Commonwealth Edison Company on this question.

Charles E. Stuart, chief of the power and light division of the Bureau of Conservation of the Federal Fuel Administration, outlined the large plans for the conservation of light and power in the coal economy program.

R. J. McClelland, chief engineer Electric Bond & Share Company, emphasized the importance to both the commonwealth and the operating company of obtaining clean coal. Even on the very conservative assumption that the use of dirty coal has increased the total consumption 6 per cent (10 per cent in some cases), it means that 1,000,000 carloads of useless dirt

is carried every year when we have such vital need of transportation facilities. Besides congesting transportation and tying up men in this business, burning of dirty coal increases the unit cost of power production and seriously impairs the operating efficiency obtainable, thereby making fuel still scarcer.

This situation, if allowed to continue, will undoubtedly result this winter in a greater fuel famine and more serious curtailment of our industries than obtained last winter. Worse still, it may cost us thousands and even hundreds of thousands of lives of our soldiers unless this winter we speed up our program and produce the supplies and instruments for their needs. Another important link in this chain is the efficient burning of coal in our furnaces. Unless a day by day check is kept of the efficiency obtained an insidious decrease will take place, which will add another large amount of unnecessary hauling and transportation congestion. Electrification of coal mines may increase their output about 8 per cent.

Reginald Pelham Bolton emphasized that it is not the central station that is burning coal uneconomically, but domestic users and some hotel, industrial plant and heating system organizations. Employment of unqualified firemen and use of unsuitable equipment are the chief causes of waste.

Alex Dow, president of the Detroit Edison Company, said that companies are anxious to abide by the rulings of the Fuel Administration and other federal bodies, but that it is difficult, if not impossible, to do so in many localities because public utility restrictions imposed by local regulatory bodies have not been lifted. Referring to the problem of securing sufficient fuel to meet demands, he pointed out that slow movement of cars and not shortage of cars is one of the principal hindrances.

P. G. Gossler, of A. B. Leach & Company, New York, referred to a specific case where a substantial coal saving was made by avoiding unnecessary lighting, and L. S. Streng, chief engineer Louisville Gas & Electric Company, suggested prompt unloading of cars to relieve congestion of transportation facilities.

Owing to the time taken up in discussing the coal situation as it affects public utilities, the Technical Section, which assembled the latter part of Friday forenoon for presentation of reports, had little time for discussion. R. J. McClelland occupied the chair. After drawing attention to the fact that the committees had confined their attention to war-time problems he called on various committeemen, whose reports are given on pages 1260 to 1263 inclusive.

DOHERTY AND BILLINGS PRIZES

The committee on Doherty and Billings prize competition reported as follows:

Doherty Medal—H. C. Pollak, Milwaukee Electric Railway & Light Company; subject, "The Electric Range as a Distribution Engineer's Problem."

Billings Prize—G. B. Springer, Commonwealth Edison Company; subject, "Underground Construction."

Honorable Mention—B. H. Blaisdell, Manila Electric Railway & Light Company; subject, "A Kilowatt-hour and the Coal Required to Produce It." Carl Horine, Commonwealth Edison Company; subject, "Electrolytic Chlorine."

A lecture illustrated with motion pictures was pre-

sented on Friday evening by Major O. O. Ellis, Infantry, U. S. A., to show how officers and enlisted men of the army are trained by means of motion pictures.

ELECTION OF OFFICERS

J. B. McCall presented the report of the nominating committee, for which the secretary was directed to cast one ballot. The following nominees were thereupon declared elected for the ensuing association year:

President, W. F. Wells, Brooklyn; first vice-president, R. H. Ballard, Los Angeles; second vice-president, Marton J. Insull, Chicago; third vice-president, D. H. McDougall, Toronto; fourth vice-president, M. R. Bump, New York; treasurer, Frank W. Smith, New York; executive committee, to serve three years, H. C. Abell, New York; H. G. Bradless, Boston; J. E. Davidson, Omaha; to serve one year, W. H. Atkins, Boston, and P. G. Gossler, New York.

Mr. Wells was then asked to take the chair with President Lieb.

In expressing his sense of the responsibility carried by the election, Mr. Wells said:

"We will do everything we can to forward the winning of the war. All that I have and all that I am will be devoted to the great cause."

The new executive of the National Electric Light Association has been vice-president and general manager of the Edison Electric Illuminating Company of Brooklyn for the last five years and has been a prominent figure in the electrical development of Greater New York almost since its beginning. He was born in Rahway, N. J., in 1870, was educated at Rutgers College, and joined the Brooklyn Edison company first as a draftsman in 1892. From 1894 to 1897 he was electrical superintendent of the company, which position he resigned to become assistant general manager of the Manhattan Electric Light Company, one of the pioneer electricity supply companies of Manhattan. When the New York Edison Company was formed Mr. Wells was made one of the district superintendents of the operating department. He superintended the installation of the electric plant at the immense Waterside station at Thirty-eighth Street and East River and upon its completion became superintendent in general charge of its operation. He returned to Brooklyn in 1905 as general superintendent of the Brooklyn Edison company, in charge of a great many of its activities. On Jan. 3, 1913, he was elected vice-president and general manager and director. He is also vice-president and general manager and director of the Kings County Electric Light & Power Company, vice-president and director of the Amsterdam Electric Light, Heat & Power Company and a director of the National City Bank of Brooklyn.

Mr. Wells has been active for many years in the National Electric Light Association, having held the offices of treasurer, second vice-president and vice-president. He was also president during 1915 and 1916 of the Association of Edison Illuminating Companies. In June, 1915, Rutgers College conferred upon him the honorary degree of electrical engineer. He is a fellow of the American Institute of Electrical Engineers, a member of the American Society of Mechanical Engineers, Franklin Institute, the Illuminating Engineering Society, the Merchants' Association of New York, the Brooklyn Chamber of Commerce, the New York Electrical Society and the Brooklyn Engineers' Club.

Symposium on Labor Conditions

The Rehabilitation of the Returned Soldier Receives Special Attention—Description of the Methods Now Being Followed in Canada—Training of the Blind and Mutilated

LEFT TO RIGHT—D. H. McDOUGALL, S. S. WHEELER, J. T. HUTCHINGS
Contributors to the Symposium on Labor Problems

THE procurement of a sufficient and satisfactory supply of labor was voiced often in the many addresses as one of the vital problems of the hour. Enlistments and drafts have eaten into the ranks of utility operators and employers to a considerable degree. The many aspects of labor supply received a general recognition and brought forth considerable discussion. In fact, this situation was of such importance that a considerable portion of the Thursday afternoon session was devoted to a symposium on labor problems of the hour.

In this symposium, which was carried over into the Thursday evening session, the broader aspects of the situation were discussed with due reference to the rehabilitation of the returned soldier as well as to the present supply of labor.

D. H. McDougall, assistant general manager Toronto (Canada) Power Company and president of the Canadian Electrical Association, gave a very full description of the work being done in Canada in training returned Canadian soldiers. James T. Hutchings, Rochester Railway & Light Company, Rochester, N. Y., told of the "Rochester plan" for helping co-operatively to man the local munition plants without disturbing labor in other manufacturing plants unduly.

Dr. Schuyler S. Wheeler, president Crocker-Wheeler Company, Ampere, N. J., who has but recently returned from France, where he has been making an investigation of the rehabilitation of the blinded soldier, spoke in the evening on that phase of the problem.

TRAINING OF RETURNED SOLDIERS IN CANADA

Mr. McDougall said, in his address, that in Canada there was established a hospital commission known as the Military Hospital Commission, which procured hospital accommodations all over the Dominion. This was taken over by the military, and there was established a

department to effect soldiers' civil re-establishment.

In considering the demobilization and employment of returned soldiers the men were divided into three classes—men for immediate discharge without pension; men who might be benefited by treatment; men permanently disabled and who could not be helped by treatment.

A system of interviews with returned men was devised. On the first interview the men are divided into two classes: (1) Those not in need of special training because they could go back to former occupations; (2) those in need of special training. Very many men who return are not capable of taking up again their former occupation.

There is in Canada a compulsory vocational training under discipline for all returned soldiers not able to take up former work. There are convalescent courses in the hospitals. In these cases the goods made are sold, the profits from the sale going to the man who made the goods.

A second interview is had with all men ready for occupation. The interviewers are largely returned men. The man is given the choice of an occupation. On the third interview he is enrolled in the proper course in one of the twenty-five schools maintained for this purpose.

There is one important feature in this connection. All men are urged to go in for productive work.

Of the 400,000 men who went from Canada to the battlefield, 35,000 had returned by April. Of these men 1230 had had amputations—520 of the leg above the knee, 320 of the leg below the knee, 259 of the arm above the elbow, 115 of the arm below the elbow. About fifty were blind. Fewer than 10 per cent of those who have returned, or 3356, required special courses.

The address was concluded with a set of lantern slides showing the extent to which Canada is rehabili-

tating the returned soldier. A number of interesting pictures of men actually in training for an occupation were given.

THE ROCHESTER PLAN

Mr. Hutchings, in describing the Rochester plan, spoke in part as follows:

"Owing to the successful and prompt manner in which shrapnel had been supplied under contracts with the English and Russian governments, Rochester was selected as a place to build a complete plant for the manufacture of a famous French gun, two shell plants and a forge shop. Early in August Major Jameson of the Ordnance Department placed himself in touch with the Rochester manufacturers. At a meeting of some fifty of the executive heads of our largest manufacturing plants he outlined to us what has since developed into the 'Rochester plan.' The problem which he outlined and which the Rochester manufacturers agreed to accept as their responsibility was to see that as fast as tools and machinery could be assembled and housed, the necessary men should be forthcoming to man these tools and at no time should there be more than forty-eight hours' delay in putting tools into production after they were ready for the operators. Up to the present time Rochester manufacturers have performed their part.

"A committee was appointed to outline the scope of the work and the method of financing the project. This committee reported on a plan to raise \$30,000 to cover the necessary expenses of carrying on the work, and, as it was felt that the principal difficulty would be in securing skilled machinists and tool makers, the first assessment was based upon the payment by each manufacturer of \$3 for each skilled metal worker in his employ and 25 cents for every other employee. This plan was immediately adopted and the \$30,000 required was underwritten. An executive committee of nine of the principal manufacturers to carry on and supervise the work was appointed. This committee immediately secured the services of a man who had had considerable experience along similar lines to take charge of and establish a central employment bureau which should act as a clearing house between all of the members of the underwriting companies and should be responsible for the supply of the necessary labor for the munition plants, and this bureau operates under the supervision of the executive committee of the underwriters.

"The munition manufacturers were asked to furnish, so far as possible, an exact schedule of the number of men required and the date on which they should be furnished. Through these methods up until about the middle of March, this year, we have been able to supply all of the labor required without interfering in any way with other Rochester manufacturers. But we have now approached the time when the real problem of supplying labor confronts us. We must begin immediately to train the semi-skilled to become skilled, the handy man to become semi-skilled and the common laborer to become handy man, and consider the possibilities of the use of women in industry.

"The total labor requirement for our war industries will amount to 12,000 men. A majority of these have been supplied. We find at the present time there are no skilled tool makers and machinists who are not employed. The problem which confronts us is to obtain the necessary skilled men to man the tools which will

very shortly be ready for operation, and to do this the committee was authorized to make an inventory of the men available in all of our Rochester factories and to authorize the employment manager of our central employment office to make a draft equally upon all of the Rochester industries, the method to be pursued being to determine from week to week the requirements and the percentage which these requirements bear to the total men available in the city and to then draw from the various manufacturers in proportion, through the application cards which we have on file, from the help in these various factories. Through this method we will not cripple any individual factory and will still be able to supply the necessary help to the munition manufacturers, and, further, we will place an equal burden on all manufacturers in the matter of training new help through their training schools."

REHABILITATING THE BLIND

Dr. Wheeler, in his address, said that there are some kinds of work that can be done as well by the blind as by those with their sight, and one of these is electric winding. There are now at the Crocker-Wheeler works forty blind men winding coils for armatures and taping at the regular factory piece rates. These men are able to earn a good living, and they rapidly acquire a feeling of independence. No contributions are allowed, for the fundamental idea is that this is not charity work.

Several things must be worked out:

1. The relation of the labor unions to the blind. The unions must know how this activity is going to work out in relation to their interests. They want to know how many blind will be employed.

2. Accident insurance. At one time employers were prevented from taking out accident insurance on the blind operatives. Now, however, insurance companies are writing policies on the blind.

3. Arriving at processes enabling the blind to do factory work. By a little ingenuity in developing devices a great deal can be done for the blind.

In France the Thomson-Houston Company came forward, stating that it appreciated the work now being done at the Crocker-Wheeler plant, and offered to help by opening a room in one of its factories for this work, by telling the societies engaged in training the blind of this work of armature winding, and by telling all of the electrical companies in France that it is going to do this. This company opened a large workroom about ten miles outside of Paris for this work and in a short time became very much satisfied with the work accomplished.

From France Dr. Wheeler went to London to help Sir Arthur Pearson. Conditions there are different from those found in France owing to the close co-operation among English electrical manufacturers through the British Electrical and Allied Manufacturers' Association. This association had a meeting to hear the facts regarding the training of the blind in this work. All of these manufacturers, about thirty of them, then decided to give work to the blind in every job that was of a suitable nature.

Two electrical manufacturing companies in Birmingham, the General Electric and the Siemens, and two more in Manchester, the Westinghouse and one other, sent coils to the shops prior to Dr. Wheeler's arrival and as soon as he got there at once started work.

Patriotic Optimism at the Dinner

P. B. Noyes Shows the Present Status of the National Coal Problem—Samuel Insull Sounds Note of Assurance and Confidence in the Rate Situation

MESSAGES of patriotism and public service, with a word of optimism from Samuel Insull for the outlook in the industry, deeply interested those who attended the dinner at the Hotel Traymore on Thursday evening. It represented the high mark of attendance at the Atlantic City N. E. L. A. war convention and was thoroughly characteristic of the spirit in the industry, in that it was a new consecration of resources to win the war and an expression of faith in the future.

The speakers were P. B. Noyes, director of the conservation division, Federal Fuel Administration; Samuel Insull, director of the Illinois Council of National Defense, president of the Commonwealth Edison Company, Chicago; Dr. S. S. Wheeler, president Crocker-Wheeler Company; Arthur Williams, Federal Food Administrator for New York City, general commercial manager New York Edison Company, and W. W. Freeman, president Union Gas & Electric Company, Cincinnati.

Reports of the addresses, except that of Dr. Wheeler, are published in this article. The remarks of Dr. Wheeler, who told of his work in bringing the blind into industry, are reported in the article on the symposium on labor problems which appears elsewhere in this issue.

President J. W. Lieb, who presided as toastmaster, said that the acceptance of an invitation to a function of this character must be conditioned on the possible call for service elsewhere; and he added that Oscar T. Crosby, Assistant Secretary of the Treasury, had telegraphed expressing very keen regret at inability to be present. An invitation had also been given to Dr. H. A. Garfield. He could not be present. The convention was fortunate, however, in having present one of Dr. Garfield's right-hand men, Mr. Noyes.

MR. NOYES ON THE COAL SHORTAGE

Mr. Noyes then spoke in part as follows:

"I would not need the testimony I have seen since coming here with you as to the spirit of this association to say what I have long ago learned, that we have no monopoly of patriotism in Washington. We recognize that there is just as much patriotism in a group like this one assembled here as in any group that could be got together in Washington, no matter who they were, so I shall waste none of your time in a patriotic address, trying to persuade you to do something for the Fuel Administration.

"When I tell people at this time of the year I believe there will be a greater shortage of coal this year than last year, I find that many men are surprised, with eight months before us to prepare for next winter, and they say, why don't you prevent it? As I have studied the problem, there is no other problem that comes to us that could not be solved by American pluck and ingenuity in eight months.

"In the coal business, as most of you realize, we are dealing in a business which has enormous physical proportions. It is beyond anything else that we undertake to do in this country. I made a calculation to illustrate it the other day. The coal movement in the United States is so much larger than the food movement that, for instance, all the wheat that is raised in the country would be moved in twenty-six days of the coal movement. Speaking of the cotton crop, a big crop, with millions of bales, that could be moved in one and one-third days of the time it takes to move the coal supply, at 9 o'clock on the second morning you would have it shipped to its destination. All the grain and the entire crops moved in this country last year, every pound of it, would be moved in fifty-four days, or something less than two months of the coal movement.

TREMENDOUS INCREASE IN COAL OUTPUT NECESSARY

"Now, when you start with that idea that you are dealing with such an enormous physical problem that time must be an element, you realize that our railroads, before this war began, were burdened; you know we were having our embargoes, and there has been very little done since that time to increase railroad facilities until very recently. Last year, 1917, we mined and delivered more than 50,000,000 tons in excess of any previous year. This year our increase indicates that we must mine and distribute 100,000,000 tons more than last year if we are to satisfy all the demands for coal.

"Our figures, as compiled during the last three months, carefully, industry by industry, show requirements of over 80,000,000 tons, and I know, and many of you realize, that we must recognize an increasing demand from week to week. There never is a week goes by that something does not come up that shows us we have not got the whole demand. So we must mine 100,000,000 tons more than we did last year; that is, more than 220,000,000 tons in excess of anything mined before this war.

"That is what the mines must mine, railroads must carry, switch and deliver to destination, more than was mined before on a railroad system that has been very little enlarged; but it must also take care of all of these enormous new supplies, shipbuilding and other supplies.

"Up to the present time the coal shortage has certainly been a railroad problem. We have lost considerable help from lack of work. Many of you know the situation. It is going to be a mixed problem before we get through. It is going to be a labor problem as well as a railroad problem. As I say, we have lost help, and the draft is taking help. If you say we must mine all this coal, yes, you can do it, and you can even get the railroads to carry it if you don't do anything else in the country, but there are all these other things to do. It all goes back to man power, and you have got to spread that man power around, to use it in shipbuilding, furnish so many to the army, and you must devote

its share to improving the railroad facilities, and getting into the mines and getting the coal out. The problem we have is to meet an increase of 100,000,000 tons, and we can't make it. If we make half of it, we will do well.

"Now, what is the answer? There are two. The first, of course, and the obvious one, is to save all we can. Fortunately this country has been a very extravagant and wasteful country. Coal has been so

© Harris & Ewing
P. B. NOYES

cheap for manufacturing interests—I won't say the utilities, because that is their raw material—only 2½ per cent, or in some cases only 1 per cent, of the cost in coal so they haven't given any attention to it.

"The second is the great question of economy of power, of getting the benefit of the power we do make by fuel, and by other means, such as water, oil and so on, and getting all we can out of it. Then there are the other avenues of waste, as the householder, and the waste of light, all of those, in six divisions, we are attacking. But to save anything like 100,000,000 tons, as you all know, or even 50,000,000 tons, is something that we get up our enthusiasm and say we are going to do, but if your life depended on it, you would say, 'Well, that is on paper,' and we had better look around to some other life preserver, rather than to depend on it.

"There also comes in it the other safety valve, which is curtailment. Now, curtailment of industry, which is the place where curtailment has to come, is almost as serious as not having shell steel. The only standard you can make is war and non-war. Now, it is easy to understand, if we are going to have a shortage, it is certainly coming out of the non-war.

"We have probably 10,000,000 men, probably \$20,000,000,000 worth of capital that is almost as important as the shell steel to the success of the war, to say nothing of the economic life of our country, to say nothing of after the war, so that I tell people to not always be saying a ton of coal means so many ships and means so many shells. Get your eye on the other end; a ton of coal in many places means a hundred people kept at work, every ton of coal you can save anywhere will keep at least fifty people at work.

"We have no right to put the utility people on the

Table A list, and be sure that they get 100 per cent coal, if 60 per cent of their power is non-war, unless they are a part of the Fuel Administration, and the other 40 per cent is handled as we would handle it. In other words, as I said to the steel people, there is no way to try to give you 80 per cent or 60 per cent of your coal. The first thing to do is to make the steel business a war industry, a 100 per cent, and then be sure it has 100 per cent coal. Now we want to make the utility business a 100 per cent war business in the double sense. Now that means that you have got to act for us on the remaining 10, 20, 30 or 40 per cent, which does not belong to any of the war needs.

"We have got to police the distribution of all the coal that can be saved from war industries. I have told the people down in Washington when we get to the district where there is only enough coal for war industries, and not a ton for anything else, we have got to be brave enough to face it, and say we are going to furnish the other industries some. If we have districts in which there is not enough coal for the war industries or any to spare, we have got to take a certain portion of that away from war and spread it around just enough to prevent disaster. Now, somebody has got to divide that, got to put it where it will do the most economic good, and you have got that same delicate problem of dividing your power, because it is not going to be fair for us to say to an umbrella man, you are only allowed your share of 70 per cent, whatever it is, and the other umbrella man alongside of him gets his power from the public utilities, which get 100 per cent.

"In other words, we have got to get close enough to you and you have got to get close enough to our problems so that we are just as safe in your hands, not only in the economical making of the power, but in the

ARTHUR WILLIAMS

distribution of it first to war industries, and second what is left along similar lines to those on which we are distributing coal, so that it will preserve this country from economic disaster."

INSULL SPEAKS WITH OPTIMISM

In introducing Samuel Insull, President Lieb said that there are many lines of activity and many directions in which people permanently identified with the

industries can and do co-operate with the government to solve the stupendous problems which are before us.

Mr. Insull said in part:

"I have been sitting listening to some of the speeches delivered to-day at our convention meetings, and I must say that a note of despair has run through some of the speeches delivered, a note which I question to be justified by the conditions existing so far as the effect of the war on our business is concerned.

"While every article making up the cost of our product is either directly or indirectly governed as to price by federal action, our selling price of our product has remained more or less stationary, but I do not agree with some of the statements made to-day to the effect that we are getting little or no relief so far as selling price is concerned. In some states the wording of the laws creating commissions is somewhat ambiguous so far as increasing prices is concerned, but as a rule the laws creating commissions in the various states leave with the commissioners the authority to increase or decrease price as necessity may arise.

"In some states we are unfortunate enough to be still operating under conditions where our maximum price is governed absolutely by municipal ordinance, but in a few cases it has been found possible to create local sentiment of a sufficient and enlightened character to result in relief from your maximum prices and an increase in the selling price of our product proportionate with the increase in our cost. We certainly have no reason, and I am speaking alone of the electric light and power portion of the public service industry because I am addressing an audience that is particularly engaged in the electric light and power business, to complain of the course taken by most of the commissions governing our business in most of the states.

"It has been authoritatively stated that of the 460 applications made for increased rates in the year 1917, upward of 400 decisions were given favorable to an increase in the selling price of the applicant appearing before those commissions, and there are but few cases that have been presented to the commissions during the first half of 1918 where some relief has not been granted.

"Our fundamental trouble is a financial trouble. It deals largely with the refunding of maturing securities and the placing of new securities for necessary capital expenditures made during the last year. We cannot expect investment bankers and investors to have confidence in our securities unless we display a confidence and belief in the earning capacity of our own business.

"The note that I wish to sound here is not one of lament that our balance sheets are not showing up satisfactorily, but it is a note of assurance. With labor increasing in cost largely as a result of federal action in addition to the ordinary laws of supply and demand, with the cost of fuel increasing partly as the result of governmental action and partly as the result of the operation of the laws of supply and demand, with freight rates increasing entirely as the result of governmental action, and with the prices of all commodities used in our business increasing as the result of the increase of cost of labor and the increase in the cost of transportation, it does not seem possible in this day and generation that we can contemplate the possibility of our selling price remaining stationary. And the experience with those of us who have appealed to the

properly constituted authorities to deal with the question of our rates gives me every confidence that if we are diligent in the presentation of our situation to those properly constituted authorities, we are bound to get relief. And as a result of that we ourselves will regain confidence in the remunerative character of our business, and if we can pass that confidence on to the investment banker and to the investment public, if we are willing to pay the price we must necessarily put up in war times for money, we should not have more than the ordinary difficulty of all classes of business in time of war in providing for new capital and a refunding of outstanding securities.

"We will get some benefit from the action of the Fuel Administration in connection with our business. True,

W. W. FREEMAN

we have had to take the benefits with the disadvantages—the disadvantages consequent upon war conditions. Every order, with few exceptions, issued by Dr. Garfield's department has had a tendency to reduce our load factor, and consequently to reduce the earning capacity of our business on the dollar invested. The first orders as to signs, while in my judgment of great advantage nationally because that order performed a great educational service in teaching our people that sacrifices were ahead of them as the result of war, affected our own earning capacity out of all proportion to the saving obtained. But if it had been my privilege to occupy Dr. Garfield's position, I think I would have issued that order just the same, as I believe that it was part of the educational campaign, the patriotic propaganda for bringing home to the people of the United States the duties that they had to perform and the sacrifices they had to make in connection with this war.

"An advantage that we obtained from some of Dr. Garfield's orders was that in connection with the advice for production of energy massed, and that isolated plants should be dispensed with as much as possible, and that large distribution systems should be connected up so as to get whatever advantage there is from the differences in diversity of load between one system and the other.

"It was rather refreshing to some of us that Dr. Garfield in his first order should have quoted the course being taken in England, and that was taken as a result of the investigation of a committee presided over by

our friend Charles Merz, who is consulting engineer for some of our companies on this side, and who to a very large extent got his ideas as to the course which should be pursued in connection with such matters from the experience he had gained from the massing of production and the centralization of distributing systems in the United States.

"To some of us who have been engaged for years in pointing out the true economics of our companies, and who have had to reply to the claims of the politicians that we were engaged in building up great power trusts, it was rather a pleasure to have the assistance of the federal Fuel Administrator in urging that the very things that we have been doing on quite a large scale in different parts of the United States should be adopted as a universal rule so far as it is possible, when such a course could be adopted. (Applause.)

"Now, there are other advantages we have gained as the result of the increased cost of our product. We have learned to do away with a lot of unnecessary expenditures, both of a capital character and of an operating character. Our business has grown with such tremendous rapidity during the last quarter of a century that those who thought we were operating the most economically have fallen into practices not at all required under the orders of various regulating bodies, but adopted largely by us to foster the getting of additional business, and we have indulged in those extravagances which, at a time like the present, when operating expenses must be watched to the limit, we have been able to dispense with. And we have been able to compensate to some extent for the losses that have been brought upon us as the result of the increased cost of labor and material.

"But we are not here to-day to look into our balance sheets so much as we are to look into matters in which we can be of real help to the government in the operation of the war.

"Now, it does seem to me that such a body of men owe a particular responsibility to the government in a time like the present. It should not need any persuasion, judging from the experience we had last winter, to prevail on an electric light and power man to store fuel. It should not need any persuasion to get him to see that his employees store fuel. It should not need any persuasion for him to see to it that the community in which he lives, either as a community or as individual manufacturers or householders, store fuel.

"But there are a great many things in addition that we can do that will be of great assistance to the government and will greatly assist in the movement of fuel and the correcting of the trouble that the union as a whole suffers from in the shortage of production.

"I do not know that I absolutely agree with the previous speaker as to the causes of the present shortage of fuel. I make that statement with some trepidation, because my experience is confined to the State of Illinois, but I do know at the present time that the miners of the State of Illinois are not working more than 60 per cent of the time. I do know that that is not owing to the action of the miners themselves or of the operators of the mines. I do know that it is owing to the shortage of open top equipment for the purpose of carrying fuel. I know that such portion of the open top equipment as is applied to the carrying of coal can carry during the summer months an infinitely greater tonnage

than is possible to carry with the same equipment in the winter months, owing to the difference in the capacity of the motive power to haul a given tonnage of coal as between the winter and summer conditions.

"There is no time and there is no capacity to manufacture new equipment. It is a case of bringing that equipment from unnecessary uses, if Mr. Noyes will excuse my using that word, and employing it in the most essential uses, namely, to provide the fuel for the purpose of moving the wheels of industry and of commerce.

"If you will, all of you, turn around and adopt the resolutions which the association adopted this afternoon, as your individual resolve, if you will see that the war activities in the communities in which you live are influenced by you in the right direction, if, in short, you will use your influence to so steer things that unnecessary local improvements will be abandoned, that the erection of unnecessary public buildings will be abandoned, that the building of club houses and places of amusement that can be held over until this war is over are abandoned, you will be going a long way to help yourselves to get fuel. And unless we get fuel in this country the government is going to be tremendously handicapped in all of its war operations." (Applause.)

MR. WILLIAMS ON FOOD CONSERVATION

Arthur Williams discussed the Food Administration law and the general lines of effort followed by Mr. Hoover. He said that the large results obtained have been secured through patriotic co-operation by the people of all sections.

MR. FREEMAN ON "SERVICE FIRST"

W. W. Freeman spoke briefly, saying:

"One thought only occurs to me and that has been suggested by one of the early speakers, Mr. Noyes, in his perfectly proper criticism of the slogan 'Safety first,' in which we all concur. It does seem to me, however, that we have had, some of us at least, in our industry another slogan that we have been trying to use, to which that same criticism might not apply, and that is the slogan 'Service first.' It has perhaps had a narrow application in its inception and in the use to which it has been applied.

"The initial thought, doubtless, was to get the public to think that, after all, service was of greater importance than cost.

"It seems to me, Mr. President, that this is both the most serious and the most inspiring convention this association has ever held, serious because we have never met under conditions that are as crucial as the conditions under which we are now met, and inspiring because we have been brought to a true realization of these conditions. We are not going to fool ourselves as to the fact, but we realize what these conditions involve in their obligations upon us, and if we respond, as I believe we are prepared to respond, to this call for service, for sacrificial service, as may be required, for service not confined to the narrow limitations of our own communities, but service which reaches out beyond these limitations, beyond even the limitations of our own nation, out to the call of humanity for sacrifice, service necessary on the part of each one, that we may be inspired in the belief, in the conviction that this service will lead to assured victory."

War-Time Engineering Problems

N. E. L. A. Considers Problems Imposed on Public Utilities by War and Outlines Some Methods Which Have Been Adopted to Solve Them

ENGINEERING problems with which the central-station industry has been confronted since the war and methods of solving them were discussed by the Technical Section of the N. E. L. A. at Atlantic City yesterday morning. Among the specific subjects considered were the following: (1) Increasing cable-carrying capacity; (2) reinstallation of old cables; (3) use of aerial cable where overhead wires are prohibited and underground construction too expensive; (4) coping with the scarcity of labor in meter departments, and (5) increasing the output of existing apparatus.

The development of water power as a war measure was also discussed.

SOLVING DISTRIBUTION PROBLEMS

Increasing Dissipation of Heat from Cables—Utilizing Old Cable—Use of Aerial Cables

The heating and carrying capacity of cables is of exceptional interest at this time, when maximum use must be made of equipment and interruptions of service to war industries must be avoided. Experience has demonstrated that underground cables ordinarily have lower current-carrying capacity during the summer than in the winter, said E. B. Meyer, chairman of the underground committee of the N. E. L. A. Failure to recognize this fact has resulted in many cable breakdowns with consequent service interruptions. To prevent undue operating expense and service interruptions

on the one hand and yet permit full utilization of the underground conductors on the other it is important that the rating of cables be known as closely as possible.

Various methods have been tried in a somewhat restricted way to increase the capacity of such cables, particularly during hot, dry seasons. Among them are cooling by the circulation of air through the cable ducts, circulation of water around the cable, hydration of the surrounding soil and immersion of the cables in materials which conduct away the heat readily.

The difficulty of obtaining material on short-time delivery, the speed with which installations have to be made at the present time and the need of conserving funds makes it imperative that all central-station equipment be utilized to the maximum. With this idea in mind some companies have adopted the practice of removing cable from certain sections of the system where load conditions have changed and reinstalling the same cable in other sections of the system where reinforcements are necessary.

AERIAL CABLES FOR WAR INDUSTRIES

On account of the large power demands imposed upon central-station companies for furnishing service to war industries, a number of operating problems have developed which have made it necessary to devise special methods of construction to serve the industries upon which the government is depending to help win the war. The matter of giving primary service to the customer has been taken care of by one company with a

INCREASING THE OUTPUT OF EXISTING APPARATUS

By forcing air from the tailrace through the generator windings the 8500-kv. units in the Stanislaus hydroelectric station can be made to carry 10,000 kw.

USING SHAVINGS AND SAWDUST FOR FUEL

Oil is scarce on the Pacific Coast, so during low-water periods one of the hydroelectric companies will use wood refuse for fuel in its auxiliary steam station.

special form of aerial cable supported by messenger wire similar to that used in telephone work.

In early installations ordinary lead-covered cable was used, but the excessive weight of this type of cable made it necessary to provide short pole spacing. Recently, however, the use of lead-covered cable has been abandoned in favor of a cable having a reinforced rubber jacket which is considerably lighter and allows installations to be made on standard pole line construction. The cable is designed for operation at 13,200 volts and is made up of paper insulation over the individual conductors with a paper jacket and a final covering of reinforced rubber, over which is applied a galvanized-steel tape for mechanical protection.

One of the advantages of aerial cable construction is that the cable may be installed on pole lines without any changes whatever in the existing construction. Two or more cables may be installed and changes or repairs made on the circuits without taking out of service any line except the one on which the actual work is being done.

The aerial cable construction is, of course, used only in special cases where it is desirable to cross underneath highway or railroad bridges and where open wire would be undesirable and underground construction costs prohibitive. The construction is somewhat more expensive than an open-wire line, but costs considerably less than an underground conduit system.

MAKING CABLE CONNECTORS FROM FLAT-BAR COPPER

At present, when the manufacturing plants of the country are working to full capacity turning out munitions and delivery of other material is uncertain, utility companies have found it desirable to make their own copper sleeves as required and at the same time effect a saving.

Bar copper, usually end pieces ordinarily junked by station construction forces, is selected equal in thickness to the wall of the sleeve to be made and cut into rectangular pieces as long as the sleeve and with a width

equal to its circumference. Each piece is heated and bent around a mandrel just large enough to allow the ends to meet at the inner edge of the copper. Then the sleeve is run through a copper saw to clear away the surplus metal, after which it is hammered to size around a mandrel equal in diameter to the required bore. The solder slot is made on a milling machine or copper saw, depending on the size and type of sleeve.

LABOR SCARCITY IN METER SHOP

Two Methods of Relief—Employment of Women and Extension of Test Periods

Since the war commenced many meter departments have been handicapped by losing the young men who had been engaged for testing meters, said E. S. Mansfield, Edison Electric Illuminating Company of Boston, in presenting the report of the meter committee. As many as 50 per cent have left either to enter the country's service or engage in more lucrative employment. Older men cannot be employed, as they demand too high wages, so only two courses lay open to the solution—employment of women and extension of test periods.

Out of thirteen companies questioned three employ women in their laboratories. In one company they range between twenty and twenty-eight years in age and are required to have a grammar-school education. Electrical knowledge is not necessary, but some evidences of thoroughness in anything undertaken are essential. The women are trained by stationing them at the test benches as assistants to the regular testers and allowing them to absorb methods by watching. Educational courses are also given as to the requirements and best methods of doing the work. One difficulty experienced in central-station meter departments which does not exist in manufacturing plants is that each tester has to handle several different types of meters. Nevertheless, the women that have been employed in meter laboratories have in most cases been

found as satisfactory as men, and they are more contented to continue at this kind of work. No women are employed on routine system testing, but they may be employed later on small meters.

Extension of meter testing periods, as mentioned before, has also been adopted by some companies, the period between tests being six to twelve months except for high-tension or very large meters. This method of coping with the labor situation is being allowed in New York until conditions become normal again.

INCREASING EQUIPMENT RATING

Use of Forced Ventilation Where Not Already Used
—Change from Delta-Delta to Y-Delta

Various methods which have been employed by operating companies to increase the output of existing equipment were cited by H. C. Albrecht of the Philadelphia Electric Company in presenting the report of the N. E. L. A. electrical apparatus committee. In the Northwest, for example, one company was able to increase the rating of two 10,000-kw. water turbine-driven generators to 14,000 kw. (continuous rating) at a cost of only \$1,000 by merely providing forced ventilation. No difficulty was experienced on the turbine end because the prime movers were rated at 21,000 hp. each. To provide the forced ventilation the generators were inclosed above the floor line, a duct connected with the space over the tailrace and blowers installed to force air along the periphery of the stator laminations. Ordinary water sprinklers were installed in the duct from which air was drawn to cool and humidify the air further. Later it was made possible to develop 16,300 kw. continuously with each machine by re-insulating the windings with material that would withstand higher temperatures. If other companies having generators driven by overrated prime movers and not employing

forced ventilation do likewise, they too may benefit, suggests the committee.

Some companies have changed from delta-delta connections to Y-delta to permit carrying larger loads with existing equipment, while others have relied on load dispatching to secure the maximum use from equipment. Transferring apparatus to a place where it can be used more efficiently has also benefited some companies. On a Southern system where a rotary serving a three-wire system was damaged so it could not be used, the company avoided a prolonged interruption of service by transferring a railway rotary to the station and re-connecting it and the transformers to give the desired voltage.

WOMEN AS SUBSTATION OPERATORS

Steps that Boston Company Has Taken to Train Women for Work in Substations

Realizing when this country was drawn into the war that men would be scarce, the Boston Edison company started in a small way to train women for certain occupations hitherto filled by men, E. S. Mansfield pointed out. Since then it has equipped them to perform the work necessary in substations, about fifteen now being thus employed.

The women were not obtained through labor bureaus or in the usual ways in which help is employed. Instead, the company asked post office representatives, druggists, etc., in different towns which it served, for the names of young women who would be likely to undertake patriotic service. At first the women were instructed in the fundamentals of electricity, but later they were put directly in the substations after having received general instructions. This was done because it was found that the women who ranked the highest in laboratory work were poorest in actual substation operation.

The general instruction course lasts about four weeks.

RUNNING CABLES ON EXISTING POLE LINES

In emergencies one cannot wait to install underground ducts for cables, especially when there is a pole line available. Besides, an overhead cable can carry more current.

WATER UTILIZATION MEANS COAL CONSERVATION

A proper development of water power with suitable interconnections with steam stations where necessary would result in great savings of coal, labor and transportation.

Then, in the substations, under supervision of the regular male operators, the women are trained in their ultimate duties. Eighteen women were trained in this way. The shifts are eight hours long and are rotated at regular periods so that no woman will have to work the same hours all the time. After receiving their training the women are examined and a rank is given them. Two work on a shift without any man in supervision.

During the instruction period they are paid the same amount as later when in actual service; that is, \$15.40

WOMEN HAVE A PLACE IN THE ELECTRICAL INDUSTRY

a week at the start. The women can earn as much as the men, the amount depending on their ability. Quickness to act in an emergency, lack of nervousness, ability to act without instruction and similar qualifications are the requirements on which they are judged to a great extent. Of the eighteen women trained, fifteen qualified and have been found quite satisfactory.

On account of the importance of this subject, Mr. Vanderpool of the Public Service Electric Company of New Jersey recommended that a committee be appointed to consider the problem.

WATER-POWER DEVELOPMENT AN EVER-INCREASING NEED

How 6,000,000 Tons of Coal May Be Saved in Twelve Months, in Addition to Labor and Transportation

For a year or more, said W. W. Nichols, Allis-Chalmers Company, Milwaukee, Wis., he had been impressed that the use of water power was possible as a war measure. Certain steps, however, have been necessary.

The common conception of water-power development would induce the thought that the application now is under high pressure and that, time being now the desideratum, this development is impossible. On the contrary, there are many different kinds of water-power development.

Moreover, there is the fact that the Fuel Administrator has just reported an estimated shortage of 80,000,000 tons of coal for the year. It would therefore appear that some practical relief outside of the coal field is imperative. Here water power lends itself to a limited extent. The year 1917 was one of inferior demand in water-power machinery, yet 1,058,000 hp. of hydroelectric machinery was built and installed. This alone represents a saving of 8,500,000 tons of coal, besides a saving in production labor and transportation. Ten per cent of the estimated coal shortage of this year therefore would be met if the industry could do as well this year.

Without building new plants there are two ways of hydroelectric development: (1) By increasing the capacity of plants already built. In this connection it has been estimated that 300,000 hp. can be developed in the next twelve months by central stations.

(2) Replacement of machinery installed prior to 1911. This would take care of an increased horsepower of 450,000.

By these means 6,000,000 tons of coal would be saved in the twelve months in addition to labor and transportation.

Power is now more than ever fundamental to our existence. The power shortage is a national calamity, calling for a broad national treatment.

The Electric Vehicle as a War Measure

Abundant Evidence That the Storage Battery Commercial and Industrial Trucks Are Taking a Prominent Part in Present-Day Transportation as the Result of Situation Demanding Development in Haulage Methods

WHILE but one paper was presented at the Electric Vehicle Section meeting—that by James H. McGraw, president of the McGraw-Hill Company, Inc., New York—the situation that now exists in the field for storage-battery-propelled vehicles was fully outlined. The paper and discussion were decidedly progressive, and gave every indication that those interested in the development of this field felt that the electric vehicle had come into its own and that the field for this means of transportation offered immense possibilities. The war has changed normal conditions, and now the electric vehicle in its commercial and industrial uses is a necessity.

ELECTRIC VEHICLE SECTION ELECTION

The following officers were elected by the Electric Vehicle Section of the N. E. L. A. for the ensuing year:

Chairman—E. S. Mansfield.

Vice-chairman—G. E. Foster.

Treasurer—H. M. Edwards.

Secretary—A. J. Marshall.

Executive Committee—J. H. McGraw, P. D. Wagoner, H. G. Thompson, E. B. Chalfont, Charles Blizzard, W. W. Freeman, L. Ward and T. I. Jones.

ELECTRICITY AN AID TO WAR TRANSPORTATION

What might almost be termed a symposium on the present status of the storage-battery truck was contained in Mr. McGraw's paper, "The Electric Vehicle as a War Measure,"

After outlining briefly the general situation and the facts that give a sharper picture of transportation conditions, the question of how electricity can help was considered carefully. In this connection there are three means of auxiliary aid to the railroad freight problem: (1) By hoists and transfer cranes and platforms; (2) by the industrial electric truck, which is being used in large numbers, and (3) by the commercial electric truck for local short-haul, many-stop deliveries. All of these are now performing a distinct war service.

The extensive application of electric industrial trucks in government war work, together with the saving resulting, were given special attention. Of these trucks it is estimated that there are 5000 in use to-day.

One of the biggest parts of the present transportation problem is the inefficiency of handling goods at terminals and from there to warehouses. In the solution of this problem by the electric vehicle lies a large opportunity for the central station and the manufacturer.

Electric industrial trucks, by conserving man power, speeding up production, and in other ways, have revolutionized the methods of handling goods in many munition factories and arsenals.

The local delivery problem, which has been the subject of national investigation, offers many opportunities to the electric vehicle. The high costs of local delivery service that now obtain are sufficient evidence of the

wastage incurred by other than truck delivery. The short-haul, many-stop deliveries provide the field for the electric truck. Another example of the present opportunity is in fuel handling.

The general advantage of the "electric" in this industrial and commercial work lies in the simplicity of manufacture and of operation, in the small amount of

JAMES H. MCGRAW

maintenance required, and in its very low operating cost.

The experience abroad with the electric vehicle was briefly touched upon, and in closing attention was once more called to the opportunity of the central station to promote this activity as an economical solution for an important part of our big transportation problem.

"The supply of electricity," Mr. McGraw said, "for the big developments to come in cheapening the cost of handling goods in terminals and warehouses, and in cutting the cost of deliveries on our city streets, is worth the attention of every central station."

Discussion

In opening the discussion John W. Lieb pointed out that the electric truck is coming into its own, a situation which has been brought about by our national economies. The key to the solution of the release and clearing up of terminal congestion lies in the electric vehicle.

A number of others spoke, all adding a note of optimism and indicating unreservedly their belief that here lies a real opportunity for the central station. The point, however, of the necessity for adequate garage and repair facilities was most strongly emphasized. Those who participated in the discussion were C. K. Chapin, Memphis; F. W. Smith, New York; P. D. Wagoner, Long Island City, and F. D. Pembleton, Newark, N. J.

Leaders in the Discussion on Commercial Section Subjects

Commercial Economics Due to the War

Factors Involved in Lighting Curtailment, Equalization of Peak Loads, Appliance Sales Stimulation and Utility Co-operation in the Sale of War Securities Occupy Attention of Commercial Session

HOW to utilize existing equipment to the best advantage and give good service was the common theme running through the papers and discussion of the Commercial Section's session on Friday afternoon. From the discussion of those participating, though somewhat limited for time, it was apparent that the electric lighting commercial men are alive to the situation.

The report of the nominating committee was presented by Thomas F. Kelly and provided for the following officers, who were elected:

Chairman, C. J. Russell, Philadelphia; vice-chairmen, John G. Learned, Chicago, and M. A. Seelman, Brooklyn; secretary, Henry Harris, Pittsburgh; executive committee, terms expiring in 1919, F. H. Gale, James R. Strong, Thomas F. Kelly, H. R. King, R. H. Tillman and E. A. Edkins; terms expiring in 1920, M. O. Dell Plain, C. E. Michel, F. D. Pembleton and A. A. Pope; terms expiring in 1921, Oliver R. Hogue, S. M. Kennedy, J. C. McQuiston and W. H. Hodge.

ECONOMICS OF LIGHTING CURTAILMENT

Owing to the changes in quality of coal and other complications the effect that lighting curtailment has had on consumption of coal cannot be easily estimated. Even if it were definitely known, it would be found negligible, said Preston S. Millar, in his paper on this subject. Nevertheless, the psychological effect may be good.

Measures adopted for the national interest ought to encourage elimination of waste, since a great saving can be realized by inducing the public to turn off lamps when not in use. The speaker said that he does not believe the stoppage of carbon and gem lamp manufacture is advisable at this time, because rugged lamps are needed for certain service. In some places, however, more tungsten lamps can be substituted for the less economical kinds.

More lighting is needed in many places to increase

production and protect the public. Several curves were shown indicating the effect of daylight saving on residential loads.

PEAK EQUALIZATION

A plan to reduce and equalize the peak load in winter months was outlined in a paper prepared by R. R. Young, Public Service Electric Company, Newark, N. J.

The territory is divided into two zones, a northern and a southern zone. During November last the co-operation of all manufacturers using 50 hp. or more was asked in the redistribution of the load.

The power representatives went out to their assignments and daily made reports. All came together once a week for a meeting to discuss progress and developments.

No provision is made in the company's rate for off-peak power. All that the manufacturer received was a reduction of his demand on the peak and the consequent assurance of greater reliability of service.

The total load was 184,200 kw., of which the relief promised amounted to 16,416 kw., or 8.9 per cent. In the northern zone the actual results showed a saving on the peak load of 10,000 kw., while the peak occurred in November. Besides there was no curtailment of energy consumption.

In the discussion D. H. McDougall, Toronto, said that the daily load factor of his company had advanced from 60 per cent in 1915 to 97 per cent at the present time. A total of 40,000 hp. of off-peak load has been taken on, nearly all of which was the result of an educational process by the company's engineers in manufacturing plants. Now the off-peak development has reached its maximum and the company can take on no more of it. A much larger revenue per plant horsepower is now being derived as a direct result.

Messrs. Dell Plain and Harris entered the discussion, the former pointing out that he had experienced little difficulty in getting large consumers to shift the peak.

The course planned by the Public Service Company of Northern Illinois to meet the exigencies of the times was briefly outlined by John G. Learned, assistant to the vice-presidents of the company, under the title "Stimulating Appliance Sales." In this connection the company is making a special effort to obtain more business from the domestic consumer. Additional outlets are urged, more appliances are being sold to customers, and those owning appliances are encouraged to use them more. Because of the depletion by the army of the sales force the company has enlisted the services of all other employees by offering a 5 per cent commission on appliance sales outside of business hours.

The author suggested that now is opportune time to encourage wiring contractors, department stores, hardware dealers and other merchants either directly or through the manufacturers of appliances to engage in the sales of appliances, since the greater the number sold the greater the income to the utility.

In concluding the paper the author spoke of the importance of increasing as far as possible the wattage of customers' lighting installations. He said: "Lamp prices should be adjusted so as to encourage the customer to use either 50 or 60-watt lamps, preferably the latter, by establishing a lower price for that particular lamp. The increased wattage will be reflected in the increased gross income."

Chairman Edkins, in discussion, mentioned that manufacturers of appliances expect to do 40 to 50 per cent more business this year than ever before. Every central station, he stated, can improve its load by developing appliance business.

H. W. Peck, Schenectady, told of selling at list 150 washing machines in twenty-two days in November and more than 100 vacuum cleaners during the Christmas holidays last year in a city of 100,000 population. The net profit in appliance merchandising has helped to reduce materially the expense of the selling department.

J. E. Davidson, Omaha, Neb., told of how he took advantage of the shortage of domestic labor in his advertising and sales solicitation, thereby boosting sales considerably. In the past year and a half sales have been at the rate of \$225,000 a year by his property, which prior to this time did no merchandising.

Messrs. Dell Plain, Pembleton, Peck and Chapin contributed largely to the discussion.

SELLING GOVERNMENT SECURITIES

The activities of the Brooklyn Edison company in assisting the government's sale of its war-time securities—i.e., thrift stamps, war savings stamps and Liberty bonds—were described by T. I. Jones. The paper showed how a public utility may utilize its commercial force in time of war to arouse public interest and obtain public help in raising the necessary money to defray the expenses of the war.

There are two methods which a public utility has of selling government securities—one to its employees and the other through them.

The campaigns described in this paper for war savings stamps and Liberty bonds were carefully worked out, and the entire sales force of the company was used for patriotic service. Company business was subordinate. Advertising and follow-up methods were devised and given as much attention as if they were business

campaigns vital to the success of the company. Every salesman was assigned to work the major part of each day, and during some periods the entire time of salesmen was devoted to the work. A written report was required of each call. Frequent meetings of the men were held for inspiration, co-operation and assistance. A daily report was written giving the name of each individual in the sales department and the result of his efforts. Copies of this report were sent to each district manager and bureau head, and an active rivalry was fostered in which each used his utmost energy to make the best showing.

Chairman Edkins directed special attention to the great service which the companies can render in selling government securities.

In discussion of this subject Henry Harris, Frank W. Smith and Frank H. Gale showed what companies and employees can do.

PAST-PRESIDENT W. H. BLOOD, JR.

Accounting Section

Toward the close of the Friday afternoon session the Accounting Section convened for the consideration of two papers, one on accounting practices and the other on accounting education. The limitations of time prevented discussion other than the reading of the papers.

ACCOUNTING PRACTICES

The paper by William Schmidt, Jr., Baltimore, on "Radical Accounting Practices," emphasized a number of advantages and economies obtained with various accounting practices and referred to the increasing use of women for this work.

ACCOUNTING EDUCATION

Owing to conditions of labor turnover the subject of specialized training has assumed a new importance, it was pointed out by Fred R. Jenkins, Chicago. This education, as applied to public utility accounting, has been taken up by the N. E. L. A. Accounting Section and a number of courses have been developed and are now in active use. These courses were described briefly, and in closing the author urged member companies to take full advantage of them for training purposes.

EMERGENCY CONSTRUCTION FOR THE WAR DEPARTMENT

Colonel Junkersfeld Reviews the Part of the Cantonment Division and the Rapidity with Which Work Was Completed

At the Friday night session of the N. E. L. A. an interesting account with lantern slides was given by Col. Peter Junkersfeld of the work of cantonment construction. How these great army centers grew up as it were over night is now a matter of history, and

COL. PETER JUNKERSFELD

the part played by public utilities in serving them was outlined by Col. Junkersfeld to the edification of the convention.

Through its investigations, the Council of National Defense determined that the matter of housing the armies to be called into service, if left to the then overloaded existing military organization, would unnecessarily hinder the development of the military resources as distinguished from problems which might be solved by the civilian body. The Secretary of War, recognizing the cogency of this fact, called to his aid a body of civilians, known to be successful and experienced in the character of construction work needed in emergency as distinguished from the construction ordinarily used for permanent or fortification work to which the army was accustomed, and developed it into an organization functioning along commercial

lines, coupling it with the military only to such an extent as was necessary to comply with law and to develop requirements. Confronted with a construction program involving work of a volume and at a rate of speed never before attempted, the Secretary of War saw the necessity of affording this organization direct access to the source of ultimate authority; free, but with resultant responsibilities to perform without the delays of military channels the gigantic task of housing the new army. The Secretary of War established the Cantonment Division, vesting it with the right to report direct to him and to communicate by order of the Secretary of War with department and other commanders.

In advance of construction the material market had been surveyed, and for each cantonment great quantities of materials had to be secured for the houses, streets, drainage and water systems required.

HOG ISLAND'S GREAT SHIPBUILDING PLANT

Fifty Shipways and Seven Outfitting Piers in This Tremendous Yard—The Part Played by Electricity

An important and highly interesting address was delivered by W. H. Blood, Jr., assistant to the president of the American International Shipbuilding Corporation at Hog Island, Philadelphia, before the N. E. L. A., covering the work done at Hog Island and giving figures on construction and making other important public announcements.

The shipyard itself will contain fifty shipways and seven outfitting piers capable of handling twenty-eight ships at one time. It is as large as six of the largest shipyards in the country at the outbreak of the war, and has a capacity equal to one-quarter of the present total capacity of all the shipyards in Great Britain.

The wires supplying electric service for motors and lights throughout the yard total 3,000,000 ft., or long enough if stretched in a straight line to run from Portland, Me., to Richmond, Va. Forty thousand electric lamps will be used to illuminate the yard and the ships and 650 electric motors will provide power.

To-day a number of delegates to the convention are to be conducted to the Hog Island yard of the American International Shipbuilding Corporation by W. H. Blood, Jr., where they will be shown some of the work.

The Effective Application of Protective Lighting

Improper Distribution of Light a Common Fault—Searchlight and Floodlamp Requirements—Floodlighting Versus Distributed Lighting—Examples of Protective Lighting

BY H. H. MAGDSICK*

EDMUND LEIGH, chief of plant protection, Military Intelligence Bureau, has stated that of the important means of protection against fires, explosions and sabotage in our industrial establishments, utilities, storage and forwarding systems, the value of lighting and its effective application are least appreciated and understood. An inspection of numerous plants and a consideration of current recommendations

FIG. 1—SILHOUETTED FORM AGAINST AN ILLUMINATED BACKGROUND

in this field of illumination confirm Mr. Leigh's statement and suggest the desirability of emphasizing the points covered in the following notes.

A protective lighting system to be effective must be comprehensive. The danger of attack from within a plant is no less than that from without. Therefore, in the majority of installations provision should be made to light not only the boundaries and approaches, but every part of the yards and all interior spaces, so that no one can approach the plant from the outside or attempt to work destruction anywhere within its limits without being easily observed by armed guards or loyal employees. Occasionally the guards may be so stationed that, while themselves concealed in a shadow or dark area, sufficient surfaces about them will be lighted so that any one passing where no light falls directly upon him will nevertheless always be between a guard and a well-lighted surface and will therefore be distinctly outlined in shadow, as is the man in Fig. 1. More often the safe and practical way is to light every part of the plant.

The intensity of illumination which is provided must be adequate to meet conditions of visibility which are short of the ideal. The amount of light required in a clear atmosphere must be considerably increased to be effective when haze or smoke is present. A higher intensity is necessary when street lamps, brightly lighted windows or other sources are in the field of vision than when the background is always black. If the

buildings are dark, more light is required than when their surfaces have a high reflection factor. An intensity entirely too low to reveal a menace quickly is one of the most common deficiencies in yard and boundary lighting. By providing illumination generously the drain on man power for guarding purposes is greatly reduced.

INEFFECTIVE DISTRIBUTION OF LIGHT A FAULT OF MANY INSTALLATIONS

Much of the expenditure for protective lighting is wasted because the light is ineffectively distributed and directed. In general, illumination should be obtained at every point from more than one unit and from more than one direction. Bad shadows will thus be obviated and the failure of individual lamps will not leave large areas unprotected. Glare often nullifies the value of lighting. Particularly is this true where one encounters exposed sources or the direct beams from projectors at a low mounting height. To facilitate vision, glare should be minimized so far as possible by using accessories which shield the eye from the light source or by mounting units high above the usual line of vision. Diffusing globes reduce the contrast in brightness between the source and its background and thereby lessen the glare somewhat in interiors or when placed near light walls of buildings. Their glare-reducing value is slight, however, when they are viewed against a black background such as usually obtains out of doors, for the ratio of brightness is not greatly reduced.

Several types of equipment employed extensively for

FIG. 2—ANGLE-TYPE ENAMELED-STEEL REFLECTORS WITH 300-WATT LAMPS

protective lighting are listed in Fig. 13. In selecting any of the equipments for out-door service one should be careful to secure well constructed, weatherproof fixtures. In a few cases the deep-bowl type of enameled steel reflector is of value in giving the maximum protection against interference with vision. Usually the

*Engineering Department National Lamp Works of General Electric Company.

FIGS. 3 TO 10 INCLUSIVE—COMPARISONS OF PROTECTIVE LIGHTING

A—Dome-reflector fixtures with 200-watt units reinforce street lighting. B—Dome reflectors around fence line. Units should be added along building face to avoid darkness cast by cars. C and D—Dome reflectors around boundary of large plot. E and F—

Same inclosure shown in C and D, but boundary is illuminated with floodlamps having spreads of 15 deg. and 25 deg. respectively. G and H—Man hiding at end of lumber pile is concealed by shadow when floodlighting is used but is clearly seen in local lighting.

dome type gives ample protection and is to be preferred because of the wider spread of light and greater output. In order that glare may be reduced with prismatic refractor fixtures, they should be ordered with the socket so placed that the maximum candlepower is

delivered at angles from 15 deg. to 20 deg. below the horizontal. The intensity at angles near the horizontal will then be greatly reduced.

It may be noted that floodlighting units are available for a wide range of beam spread, permitting

to meet varied requirements. With the specially concentrated filaments of the floodlighting lamps, accurate control of the light is possible, so that beams of small as well as large angular divergence can be obtained. The projectors shown at *c* and *d* in Fig. 13 are designed for use with such lamps. Equipments illustrated in *a* and *b*, which employ the regular multiple lamps pendent in the reflector, do not permit confining the beam to so narrow an angle because of the greater area of the light source.

The percentage of light directed into the beam varies greatly. Two characteristics determine the efficiency of projectors—the reflection factor of the surface and the depth of the reflector, *i.e.*, the percentage of the light from the lamp intercepted. Mirrored glass is becoming the standard reflecting surface, for it has a high efficiency which can be permanently maintained. The reflection factor is from one-fourth to one-third greater than that of the polished aluminum and nickel surfaces commonly employed in metal-reflector units.

SEARCHLAMP AND FLOODLAMP REQUIREMENTS ARE DIFFERENT

A large number of floodlighting projectors are still sold with shallow parabolic reflectors, directing only 18 to 25 per cent of the light into the beam. This condition exists because many designers have followed

ally required and the scattered light does not become detrimental, but on the contrary is frequently useful.

For most floodlighting it is possible to employ the deeper reflectors with contours formed and combined in such a manner as to redirect a large proportion of the light from the lamp. Such deeper projectors are illustrated, for the ordinary multiple and floodlighting lamps respectively, in *b* and *d* of Fig. 13. The common practice of employing the shallow paraboloid with the ordinary multiple lamps of large light source, as in *a*, is obviously very wasteful, when with an intelligent design it is possible to increase the output in the beam by from 50 to 100 per cent.

With the possible exception of the opal-globe equipments, all types of units listed in Fig. 13 can be used advantageously under many conditions, although each is better adapted than the others for certain applications. Many people have come to regard floodlighting units as the one type of equipment suited to protective service. The fact that they are relatively new and that they opened up new possibilities in lighting seems to have led to an exaggerated estimate of their performance and value. From Fig. 13 it is apparent that a projector mounted at a remote point actually delivers less light to a given area than would be secured from ordinary types of equipment in this area. However, it does not follow that the latter are always to be pre-

FIGS. 11 AND 12—BEAM FROM SEARCHLAMP FOCUSED ON ONE SPOT; BROADER BAND OF LIGHT PRODUCED WITH SAME SEARCHLAMP FITTED WITH FACTORY-RIBBED GLASS COVER

searchlighting practice without differentiating between floodlight and searchlight requirements. In designing or using searchlamps one is concerned only with securing the highest possible intensity at the center of the beam. It is desirable to suppress the light radiating at wide angles from the center of the beam so that the observer watching the distant illuminated area from his station near the searchlight may suffer the least interference with vision. The spread of the beam is determined by the angle which the light source subtends at the reflector; hence best results are obtained by using a paraboloid of relatively long focus, and therefore shallow, for a given diameter. In floodlighting one is concerned with delivering as large a percentage of the light from a lamp as possible to an area at a relatively shorter distance and viewing this area at closer range. Therefore a greater divergence of beam is usu-

ferred; due weight must be given to other factors as well. The relative advantages of lighting with floodlamps and with distributed systems of the other types of lighting units may, in a general way, be summarized as follows:

FLOODLIGHTING VERSUS DISTRIBUTED SYSTEMS

Dome and angle enameled-steel reflectors and prismatic refractor fixtures must be distributed at moderate spacings on supports relatively near the area to be illuminated. This distribution of units results in the marked advantage that at a given point light is usually received from several lamps and from different angles, thus obviating dangerous shadows and minimizing the effect of the outage of an individual lamp. Such equipments are efficient and their cost is relatively low. To mount the fixtures, however, it is sometimes necessary

to erect additional poles or other supports and extend the lighting circuits.

With projectors a different practice may be adopted, for the control of light in narrow beams gives the advantage of mounting equipment at a few favorable points, often on existing circuits, and delivering the light to areas at a distance. Thus the cost of additional poles and wiring is frequently saved, but this advantage is usually more than offset by the relatively high cost of the projectors themselves and the somewhat lower utilization of light flux. This is particularly likely to be the case if a sufficient number of lamps are installed at different points to eliminate long, sharp shadows. Furthermore, it is difficult to arrange flood-lamps so that objectionable glare will not at times be experienced, nullifying much of the value of the light.

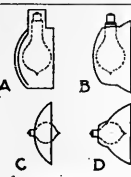

EQUIPMENT FOR PROTECTIVE LIGHTING			
ACCESSORY		LAMP	PER CENT OF LIGHT FROM LAMP DELIVERED BELOW HORIZONTAL
 DOME TYPE ENAMELED STEEL REFLECTOR		Mazda B and Mazda C; Multiple of all sizes to 1000 watts	75 - 80

FIG. 13—TYPES OF EQUIPMENT EXTENSIVELY USED FOR PROTECTIVE LIGHTING

Nevertheless, when they can be carefully located and mounted high on pole brackets, platforms or roofs of buildings excellent lighting may be secured. The outage of individual projectors is likely to be far more serious than that of a unit of the other types in a more distributed system; also, where a number of projectors are mounted on a platform there is danger that all of the lighting for a large area may be put out by one quick attack. Floodlamps are particularly valuable for providing light quickly in an emergency, for supplementing the ordinary systems and temporarily reinforcing the intensity at certain points. They fill a great need in illuminating locations in or near which no wiring can be carried or no supports placed for the older types of lighting fixtures.

A number of applications of the lighting equipment listed in Fig. 13 are illustrated in Figs. 2 to 12. The plant shown in Fig. 2 is located directly on a city street and the units employed are angle enameled-steel reflectors with 300-watt lamps attached to the build-

ing. For mounting heights of 25 ft. (7.6 m.) or more, and spacings not more than twice the height, this system is a desirable one, although sometimes it may be improved by tilting the units in slightly to minimize the glare. Where the building surface is light and for lower mounting heights, dome reflectors are preferable, spaced not more than three times their height.

Dome reflector fixtures with 200-watt units mounted 20 ft. (6 m.) above the pavement reinforce the street lighting in Fig. 3. On the building face are two angle units which help to illuminate the space in front of the building and assist the watchman in identifying persons approaching the plant. A similar installation of dome reflectors is carried on the pole line along the fence bounding another side of this property (Fig. 4). In either case the spacing should not be more than four times the height of the units. Higher mounting is advantageous; a height lower than 20 ft. (6 m.) is likely to be objectionable except for lamps as small as 100 watts. It may be noted that the cars which have been left standing in the yard throw the strip adjacent to the building in darkness. Units should have been added along the face of the building to prevent this condition.

Dome reflectors like those just referred to but equipped with 100-watt to 500-watt-lamps are also particularly suitable for protecting the boundaries of large inclosures, as shown in Figs. 5 and 6. The views are respectively those of a patrolman on the ground and a watchman at an elevated post. Prismatic refractor fixtures are also desirable for this service. They illuminate a wider zone, and the spacing may be increased to eight times the mounting height. The largest sizes of lamps are therefore often employed with such equipment.

The same inclosure protected by a zone of light from projectors with a beam spread of 15 deg. and 25 deg. respectively is shown in Figs. 7 and 8. One edge of the beam is directed along the fence, allowing the patrolman to walk inside in comparative darkness. The projectors are placed 12 ft. (3.6 m.) above the ground, one every 200 ft. (60.9 m.), and the beams pointed in one direction around the inclosure. So long as the patrolman is able to walk in the direction in which the projectors are pointing, conditions for vision are excellent. If, however, it becomes necessary for him to turn around and face the units, the glare he experiences will make the lighting ineffective. Therefore it is better to mount the projectors high on pole brackets or elevated platforms. When they can be placed 30 ft. to 60 ft. (9.1 m. to 18.2 m.) above the ground the interference from glare is very greatly minimized.

An error which is commonly made is to space projectors at too great a distance. The range is rapidly reduced as the atmosphere becomes hazy; also the outage of a unit becomes more serious as the spacing is increased. Where mounted low, as in the illustrations, the maximum spacing recommended is about 250 ft. (76.2 m.), and this value should be reduced for the widest-angle units. Under favorable conditions, where the projectors are mounted high and the largest lamps are employed, the spacing may be increased.

For lighting the yard proper, various types of accessories may be utilized. Angle reflectors attached to the buildings may be employed to light adjacent spaces, if mounted 25 ft. (7.6 m.) or more above the ground.

Dome reflectors and prismatic refractors on brackets attached to buildings, poles distributed throughout the yard, etc., meet the requirements best in the majority of properties. When floodlighting projectors can be placed sufficiently high and at various points so as to deliver light from several angles, good results may be obtained by their use. However, there is always danger that glare will not be sufficiently minimized and that piles of material or other obstructions in the yard will cast long, dark shadows, creating an accident hazard and affording a place of concealment. Such a condition is illustrated in Fig. 9, where the light is coming from one projector. With a greater number of smaller wattage lamps in dome reflectors distributed about the yard, these dark shadows are eliminated and the guard is able to detect the intruder (Fig. 10). The conditions could also have been improved if projectors had been directed at this point from both sides.

Narrow-angle floodlamps on building roofs or elevated platforms are valuable in lighting long approaches to a plant or sweeping open fields or waterfronts about a property. Incandescent-lamp searchlights greatly increase the range. With one of these the attendant will be able to "pick up" a man at distances as great as one-half mile (8 km.). In Fig. 11 the beam from a searchlamp of this type is directed at a point about 1000 ft. (304 m.) from the building on which it is mounted. Occasionally it is of value to have a beam which is wider horizontally, while any greater spread vertically would be wasted. Under these conditions a piece of factory-ribbed glass may be substituted for the clear-glass cover, resulting in a band of light of wide horizontal divergence but little vertical scattering, as shown in Fig. 12. The intensity at the middle of the beam and the range of the unit are of course considerably reduced.

Readjustment and Reconstruction Commission—II

The President's Commission, Composed of Experienced Men in the Industrial, Commercial, Financial, Transportation, Labor and Educational Worlds, Would Help Make Us Ready

BY WINGROVE BATHON

Washington Representative ELECTRICAL WORLD

AN OUTLINE of a proposed Presidential readjustment and reconstruction commission, to deal in this country, now, with problems that will present themselves after the war, was suggested in these columns on June 1. It was suggested that such a commission, appointed by executive order of the President of the United States, with personnel selected from leaders in private industrial effort in the United States, should have the assistance of an advisory council, also appointed by executive order, whose personnel should be selected from executive officials and legislators of the government.

SUGGESTED PERSONNEL OF COUNCIL

Such an advisory council should be selected from those who are especially charged with the conduct of affairs vital to the industrial, commercial, financial, transportation, labor and educational worlds. Realizing the demands made by the war on the chief Cabinet officers, it should not be expected that they should serve actively on such a council, although in one or two cases, such as that of William P. G. Harding, the governor of the Federal Reserve Board, principal officials, rather than those second in command, ought to be selected. In the case of legislators, many chairmen of Senate and House committees are also too much occupied with war legislation to deal now with after-the-war problems. Officials of executive departments on such an advisory council should be charged not only with the duty of giving advice and outlining governmental policies of the present and possible policies of the future, but should detail to the service of the commission experts in their own departments. In the following list strict order of precedence and rank in the government is not followed, but such an advisory commission or council should include:

Frank Lyon Polk, counselor for the Department of State, for all international contact.

F. M. Simmons, chairman of the Senate committee on finance, for contact on future government revenues and taxes.

Claude M. Kitchen, chairman of the House ways and means committee, for contact on future government revenues and taxes.

Duncan U. Fletcher, chairman of the Senate committee on commerce, for contact on legislation affecting commerce.

Thetus W. Sims, chairman of the House committee on interstate and foreign commerce, for contact on legislation affecting commerce.

Gilbert M. Hitchcock, chairman of the Senate committee on foreign relations, for contact on future international legislation.

Henry D. Flood, chairman of the House committee on foreign affairs, for contact on future international legislation.

John Bassett Moore, vice-chairman United States Section, International High Commission, for contact with international law, patents, trademarks, etc., in Latin America.

John Barrett, director general Pan-American Union, for Latin-American contact in detail.

William P. G. Harding, governor Federal Reserve Board; Charles S. Hamlin, president Capital Issues Committee, and Sherman Allen, treasurer War Finance Corporation, for contact on finance.

E. R. Stettinius, Assistant Secretary of War, for contact in industrial war production, and Rear Admiral Samuel McGowan, paymaster general of the navy, for contact on industrial naval production.

Maj.-Gen. E. H. Crowder, provost marshal general, for contact on reintroducing returned soldiers to industry.

William H. Taft and Frank Walsh, chairmen War Labor Board, for contact with war labor problems and activities.

John A. McIlhenny, president Civil Service Commission, for contact on government employment.

Carl Vrooman, Assistant Secretary of Agriculture, for contact with the soil and its agricultural products.

Edwin F. Sweet, Assistant Secretary of Commerce, for contact with the census and other bureaus dealing with commerce.

William B. Colver, chairman Federal Trade Commission,

for contact with the coming administration of the Webb act, which permits combinations for foreign trade, and for contact on unfair practices under the Newlands act.

F. W. Taussig, chairman United States Tariff Commission, for contact on material now being gathered by commission on after-the-war problems.

Raymond B. Stevens, vice-chairman United States Shipping Board, for contact on tonnage available after the war.

Herbert Hoover, United States Food Administrator, for contact on food licenses during reconstruction period and possible repeal of laws.

H. A. Garfield, United States Fuel Administrator, for distribution of coal and oil and possible repeal of laws during and after reconstruction period.

Walker D. Hines, assistant to the Director General of Railroads, for contact with transportation and terminals after the war.

A. Mitchell Palmer, alien property custodian of the United States, for final disposition of enemy-owned plants and other property.

Bernard M. Baruch, chairman of the War Industries Board, for contact on sources of supply of raw materials and finished products.

Walter S. Gifford, director of the Council of National Defense, for contact on reviving less essential industries.

Vance C. McCormick, chairman War Trade Board, for contact on licenses for imports and exports after the war.

Executive secretary (when named) of the water-power commission of Cabinet officers which is about to be created.

Daniel C. Roper, Commissioner of Internal Revenue, for contact on collection of excess profits taxes, etc.

Charles D. Walcott, president National Academy of Sciences, for government contact with the sciences.

Charles F. Nesbit, Division of Military and Naval Insurance, for contact on personal insurance problems and defectives on his rolls who are returned soldiers.

Philander P. Claxton, Commissioner of Education and secretary of the Federal Board for Vocational Education, for contact on educational statistics and statistics on defectives.

George Creel, chairman committee on public information, for assistance and contact in educational work.

It is respectfully submitted that this is no mere list of names. Broadly speaking, it is an analysis of the industrial war organization of the United States, and a reading of the suggested contacts will show that the work of these officials and that of their departments, bureaus and associates will be just as vital to the solving of after-the-war problems as it is vital to winning the war now. The two problems cannot be separated. All national contacts to-day are international. We think and move in terms of world-wide importance.

TASKS THAT WOULD CONFRONT COUNCIL

After four years of war England has found it necessary to tear up and move to France between 15 and 20 per cent of her main-line tracks. If the war goes on a long while, if there is not iron enough, if there is not steel enough, if there is not labor enough, if there is not constant maintenance, something like that might happen in this country. Then there will be need for actual physical reconstruction in this country, as there is abroad, instead of need merely for readjustment. Plans for such possibilities must be made now. Again, it is estimated that we shall have within a year from 45,000 tons to 50,000 tons of steel-ingot producing capacity and probably 100 per cent greater finishing-machine producing capacity than we had in 1913, in which year we were obliged in many lines to go abroad for a market for our surplus production. What plans are in the making for our surplus production after the war? Again, it is estimated that we shall have, with what we now have, 15,000,000 tons in merchant ships available

after the war. What definite trade routes from American ports to the other ports of the world are being thought out?

The biggest American businesses which have been built up abroad have been in machine-finished steel products, such as talking machines and music machines, cash registers, agricultural machinery, adding machines, sewing machines, etc. Plans must be made to introduce these special products. One company now represented in Washington desires to open an office at Rio de Janeiro; another desires to send 600,000 tons of shipping to Australia next year. Is there any governmental agency or semi-governmental agency in Washington to offer encouragement or authoritative advice? No.

What is being done to divert to American ports the rehandling business previously done in Europe, such as the bringing of rice from India, to reclean it, regrade it and reship it? What is being done to hold for the United States the rubber which formerly went to England, now coming here to avoid two trips through the submarine zone? What is being done to hold for the United States the business in tin which formerly went to England and Holland from Bolivia? What is being done to hold for the United States the business in coffee which originally went almost entirely to Europe, at which time we paid for the longer freight haul and commissions in London, Hamburg and Bremen, and much of which now comes to this country?

An advisory council such as has been outlined in this article, working with the proposed Presidential readjustment and reconstruction committee or commission, could answer these questions, if answers are in existence; and if not could place industry through the commission in a position to meet such problems as have been suggested and a thousand more. The United States Tariff Commission is one of the few governmental agencies which are avowedly gathering data for after-the-war problems. The Federal Trade Commission, the Department of Commerce and the War Trade Board are also collating information. But there is no apparent co-ordination of these efforts, such as there is in England and other countries. The next article in this series will deal with what is being done in that respect in England.

Book Review

THE EMPLOYMENT DEPARTMENT AND EMPLOYEE RELATIONS. By F. C. Henderschott, New York Edison Company, and F. E. Weakly, employment manager Montgomery, Ward & Company. 60 pages, illustrated. Chicago: LaSalle Extension University.

With the present high rate of turnover this volume, published as part of the material for the course in business administration at LaSalle Extension University, becomes of unusual interest. It describes the organization and duties of an employment department, the function of its manager, relations to other departments, sources of labor supply and the scientific method of selecting those to fill situations. Practical questions of transfers, promotions and general welfare work are discussed. The analysis sheets of physical examinations of "turnovers" ought to prove particularly suggestive.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

A SCHEDULE BOARD FOR ENGINEERING DEPARTMENT

Plan Which Allows the Schedule of Any Job to Be Changed Without Disturbing the Remainder of the Board

BY H. E. WULFING

For the purpose of keeping the members of the engineering department and others interested informed as to the work on hand—its progress and the scheduled date for completion—the Commonwealth Edison Company of Chicago has installed in the en-

BOARD INDICATES PROGRESS OF JOB AND ESTIMATED DATE OF COMPLETION

gineering department the novel schedule board shown in the illustration. The board proper is about 5 ft. (1.5 m.) high by 16 ft. (4.9 m.) long and is divided into two sections, the first section showing the class of the station, the name of the substation and a description of the work to be done. The second section is the schedule proper.

The first section is backed by cork linoleum, on which are pinned strips of paper showing the name of the substation and a brief description of work to be done. The second section is divided vertically into twelve parts headed by the months of the year, and at intervals of about 1 in. (2.54 cm.) steel wires are strung horizontally across the board. Strips of colored bristol board are attached to these wires by means of a paper clip. The color of the bristol board represents the kind of work being done—that is, whether building work or electrical construction—and the length of the strip indicates the estimated time to complete it. The location of the strip of paper on the wire indicates the time at which it is proposed to do the work. In order to facilitate reference the work involved is printed on the strip.

By means of colored stars pasted on each strip the date at which apparatus is to go into service is indicated. Other colored tags indicate apparatus to be moved or removed. A movable index is hung on a rod from the top of the board, indicating the current date.

The board is maintained as follows: As soon as the installation of apparatus is authorized the head of the department issues a preliminary order covering the engineering work and giving the scheduled date of com-

pletion. This order is issued in multiple and copies are sent to the engineer of design, the engineer in charge and the clerical division. The engineer of design makes an estimate as to the probable time it will take to complete the work. This information is given to the clerical division, which incorporates it on the schedule board. Any changes in the scheduled date or the probable duration of the job are made by supplementary orders to the original order by the head of the department, so that any additions or changes in this schedule board are made by his authority only.

This board has the advantage over a printed schedule in that it is possible to easily change the schedule for any one job without disturbing the rest of the board. As a result of this the schedule leads the work instead of lagging, as is the usual case.

LIGHT STRUCTURAL CARRIER SAVES TIME IN MACHINE TESTS

Meter Placed in Upright Position Near Apparatus
Eliminates Temporary Construction and
Obviates Use of Nails

To facilitate the use of a heavy curve-drawing ammeter in substation tests, H. J. Howarth, superintendent of the meter department of the Cumberland County Power & Light Company, Portland, Me., has designed

STRUCTURAL STEEL FRAME FOR TEST METER

the structural steel carrier illustrated herewith. The 2000-amp. meter is provided with four bolts so that it can be hung in four slots in the carrier. The frame is 30 in. (76 cm.) long, 23 in. (58.3 cm.) wide and 4 ft. (1.2 m.) high. The meter can be securely installed on the carrier by one man.

ASBESTOS INSULATION REDUCES LEAKAGE AND CONSERVES HEAT

Investigations of United States Bureau of Mines Show that Brick Conducts Heat Faster than Asbestos and Increases Loss in Boiler Settings

The use of asbestos insulation between the courses of the brick settings of boilers reduces air leakage and conserves heat that is usually wasted with the ordinary air space, according to recent investigations of the United States Bureau of Mines. Firebrick should withstand temperatures up to 3000 deg. Fahr., but it is a good conductor of heat and conducts it six to ten times as fast as the asbestos felt. Red brick conducts heat about five times as fast as the felt. Insulating material with smaller air spaces reduces convection losses far better than material with the larger air spaces. This practice is especially timely with the present fuel prices, and the result shows that it is not economical to use cheaper insulations for high steam pressures. When subjected to temperatures of 1200 deg. to 1500 deg. Fahr., the disintegration of the better grade of asbestos fibers starts and the material gradually becomes more brittle, not going to pieces, however, much below 1800 deg. Fahr.

SUBMARINE CABLE LAID UNDER MISSISSIPPI RIVER

Eliminates Necessity of New Machinery and Provides Permanent Connecting Link Between St. Louis and East St. Louis Companies

Two 5000-kw., 13,200-volt, three-conductor submarine cables about 2500 ft. (762 m.) long have recently been laid across the Mississippi River, connecting the systems of the East St. Louis (Ill.) Light & Power Company and the Union Electric Light & Power Company of St. Louis, Mo. These cables form a connecting link between the two systems and eliminate the necessity of the immediate installation of new machinery on the Illinois side of the river.

The cables consist of three No. 4/0 B. & S. gage conductors insulated with 7/32-in. (0.551-cm.) 30 per cent rubber compound and 1/16 in. (0.16 cm.) varnished cambric. The conductors are held together with a band of 1/8-in. (0.3-cm.) varnished cambric and a 9/64-in. (0.36-cm.) lead sheath. This sheath is covered successively with two layers of tar jute braid, an armor of No. 4 B.W.G. steel wire and two layers of asphalted jute braid.

The cables were laid simultaneously from a barge towed by tugs. The actual work of laying the cables required only about one and a quarter hours, and the entire job was completed by working continuously for sixteen hours. Four reels of cable in 1250-ft. (381-m.) lengths were placed upon the barge and two reels were paid out at the same time. The cables were then spliced to the remaining two reels by means of standard splice boxes and the remainder of the cable was laid. Considerable difficulty was encountered during the splicing owing to the tendency of the cables to go downstream. This was prevented by heading the tugs upstream and running the propellers while the splicing was in progress.

The cables are connected to the Ashley Street power

house on the Missouri side by two 1500-ft. (457-m.) standard underground cables. The Illinois end of the cables terminate in a switch house on the river levee. This cable is laid at a depth of about 3 ft. (0.9 m.) underneath the levee and is protected at its terminals by aluminum-cell lightning arresters. The two cables can be paralleled in the switch house by disconnecting switches. The remainder of the connecting link between the two systems consists of an overhead transmission line running from this switch house to the Lake Street substation of the East St. Louis company.

CHART FOR DETERMINING ECONOMY OF INSULATION

Permits Comparison of Expense Chargeable to Pipes Insulated with 85 per Cent Magnesia with That of Uninsulated Pipes

BY AUSTEN BOLAM

By calculating the volume of heat loss from insulated pipes and adding the fixed expense and cost of maintaining the insulating material a decision can be reached

TOTAL EXPENSES CHARGEABLE TO PIPE INSULATED WITH 85 PER CENT MAGNESIA

as to the expenditure which can be economically made to insulate pipes. Curves which take these considerations into account are given in the accompanying illustration, the actual cost per year per square foot of surface covered being shown direct.

The horizontal lines represent the cost of upkeep, and the curves radiating from zero give the value of the heat losses at various temperature differences. The temperature difference to be used is found by subtracting the temperature of the surrounding air from the temperature of the steam in the pipes. By adding the constant and variable costs the total expense chargeable to insulated pipes is obtained. This is shown by the remaining curves.

Referring to a handbook or similar source of information, the loss from bare pipes can be obtained and a comparison made. The experiments on which this chart was based were made at the Mellon Institute of Industrial Research at Pittsburgh, Pa. Insulating material known as 85 per cent magnesia was used in the tests, which covered a year's time.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

SALESMAN'S ASSISTANCE IN SELECTING TRANSFORMER SIZES

From a Careful Study of Load to Be Connected a
Considerable Saving in Transformer
Capacity May Result

BY A. G. DRURY

The salesman for the central station is finding the rising cost of construction quite a formidable consideration. The central stations are more conservative than formerly in making extensions, owing to their exorbitant cost, and many are asking the prospective consumer to pay a part of the expense. It is well known that the more money a "prospect" is asked to advance the harder it is to close the contract. It follows therefore that any information which the salesman can gather that will tend to decrease the expenditures will make it easier to do business.

The primary function of the construction department is to build and maintain the lines as economically as possible, and any assistance which the commercial man can lend in this work by his knowledge of the character of the power load to be added is likely to be appreciated by the superintendent.

One way in which to assist is in the selection of the size of transformers. It is evident that if at the end of the year the reports show that 2000 kw. connected load has been added to the system with 1000-kw. transformer capacity, it is better than adding 2000 kw. and 1500 kw. in transformers most of which are under-loaded. The advantage exists not only in the amount of capital saved, but also in the amount of energizing current required by the smaller transformers as compared to the larger one.

As a concrete example there is related an incident which came up in connection with a contract for supplying electric energy to a company which made small brass and bronze casting cages such as are used in receivers' booths in banks, etc. The equipment which was to be driven by motors consisted of an elevator, a blower for gas furnaces, emery grinders, polishing machines, lathes, a milling machine, drill presses, etc., in all twenty-four such pieces of apparatus. The total number of motors to be installed amounted to 42 hp. The salesman had become familiar with the character of the work and reported that he had secured a 15-kw. maximum-demand contract. The manager accordingly ordered three 4-kw. transformers. One of the men in the office, knowing the motor equipment to total 42 hp., out of friendliness to the salesman told him that three 4-kw. transformers had been ordered, when there should have been three 10-kw. machines. Upon inquiry it developed that the rule was for the salesman to report 40 hp. or 30 kw., upon which three 10-kw. transformers would be purchased, whereas with co-operation established between the two departments considerable saving in equipment would be accomplished.

The difference in first cost is as follows:

Cost to purchase and erect three 10-kw. transformers.....	\$271.50
Cost to purchase and erect three 4-kw. transformers.....	144.00
Saving in first cost.....	\$127.50

A test made on the installation mentioned after completion showed the maximum demand to be 12 kw.

The salesman by studying the characteristics of any new business can save as well as make money for his company. From considerable experience similar to the above the writer has found that the capacity of the transformers serving an installation can often be limited to less than a third of the connected load; but the salesman must make each individual investigation himself and not rely on the published tables of average load or maximum demands for different manufacturing businesses. The time and energy invested will be justified by the returns.

ELECTRICAL ENERGY FOR HOUSING REQUIREMENTS

Considerations Which Will Govern the Supply as
They Have Been Outlined by Government
Committee in Charge of Work

It has been definitely decided by the Bureau of Industrial Housing and Transportation to light the industrial homes with electricity where this is available.

The considerations governing the installation of electricity and lighting are outlined by the bureau as follows:

1. It is to be expected that usually the housing development will only introduce electric light and energy when adjacent utilities are available and can extend their service into the district.
2. It is possible in exceptional cases that plants for this purpose may have to be created. If so, experienced electrical and mechanical engineers should be engaged to design and construct them.
3. When existing utilities are available, some form of contractual relation must be entered into by which rates and service standards will be defined.
4. Under ordinary conditions overhead distribution is contemplated, preferably by pole lines installed as far as possible in alleyways.
5. Under conditions where frequent street lighting is afforded by electric energy, modification of this method may be necessary and desirable in some cases.
6. Standards of materials and construction will, as a rule, be similar to those adopted and defined in the existing ordinances in the community where they are installed.

The bureau suggests that the investigation of local utility service should include a full description of the local electric light and gas plants, with a statement of capacity, connections, cost, street-lighting methods, rates and reliability of service.

DISTRICTING CITY AS AID IN SUMMONING PHYSICIANS

St. Louis Company Informs Employees Concerning Methods of Handling Emergency Medical Calls

When the services of physicians are required in emergencies by workers for electric light and power companies the saving of a few minutes sometimes means saving or failing to save the life of the victim. In order to reduce as much as possible the time required in calling the proper physician and getting him quickly to the injured person, the Union Electric Light & Power Company of St. Louis has divided the city into five districts and has published a map showing the divisions between these districts and giving the name and telephone number of the doctor who should be called in case of an emergency within any district. Employees of the company are urged to keep the chart where it will be instantly available.

THE KIND OF PUBLICITY FOR INCREASED RATES

Public Must Be Shown the Same Things That Are Put Before the Commission, but in a Simple and Direct Manner

To go about the matter of obtaining higher rates is a new idea. Formerly the utilities had to contend with the possibility of having their rates lowered. There was no thought of raising rates. Now that the necessity for higher rates has become evident new practices must be developed. It is pretty generally held that to be entirely successful in this connection the confidence of the public as well as that of the commission must be obtained.

This idea was developed to some extent by L. W. W. Morrow, director of the School of Electrical Engineering of the University of Oklahoma, at the recent annual convention of the Oklahoma Gas, Electric and Street Railway Association. He said:

Extension of service and more than necessary service are the watchwords of successful utility operation. The task of the utilities is to show the public that present conditions mean decreased service or advance in rates, and to get the public to accept voluntarily the increase in rates upon decision of its representatives, the corporation commission.

The gist of every publicity argument should be that unless rates are advanced service will be decreased. The latter condition will not be permitted by the public, whose demand is more and better service. The utilities must show:

1. That they are not getting a fair return on the actual capital invested.
2. That their financial condition is not a temporary condition with relief in sight, but is in fact increasing in seriousness with the lapse of time.
3. That the increase is necessary in order to furnish adequate service of the kind the public requires.
4. That the increase desired is only reasonable and just and that their motive in asking it is only the application of fair dealing to present conditions.

The public must be shown the same things a commission is shown, but it must be shown these things in a simple and direct manner. No lengthy treatise on "going concern," "depreciation," "reproduction," "new value," etc., appeals to the public. Simply show that operating expenses are so much, operating revenues another sum, and the difference inadequate to furnish the service desired by the public.

The utility publicity man must have several essential characteristics. He must be able to marshal his facts and

present them in a telling and effective manner. He must believe in his own case enthusiastically and must be perfectly frank with his audience. He must be the personality of his company—no one cares about the hardships of the Blank Electric Company, but John Jones is a definite personality and his views and opinions are quoted and considered. The personality of the manager of a utility solves many vexatious problems in public relationship. The publicity man must establish the fact that a partnership exists between the utility and the public. Every one gets his share in the business either in wages, taxes, service or other returns. No one can take more than his share without affecting the others. The publicity man must reduce his statistics to the value of a dollar in order for the public to comprehend them. A balance sheet is a cipher to the average citizen he tries to reach. Publicity must be simple and concise—one fact at a time must be treated, and that fact must be handled in a manner to fix it in the mind of the citizen.

There are many methods for obtaining publicity—the newspapers, newspaper advertising, circulation, posters and street cars, addresses before civic bodies, personal relationship between the employees and the public are all legitimate means for obtaining publicity. The newspaper is the chief agent, as it reaches the maximum number of people. The publicity of the individual plant must be handled locally—no amount of generalization will be read by the local citizenship. The manager of the local utility is the one person to handle the public. A central bureau can compile his facts and arrange his material, but the manager's personal touch is essential in getting these facts across to his public. A lecture bureau is a great help in presenting matters to civic bodies of a general nature, but every question that is in dispute should be personally presented by the manager, even though in many cases he is far from being a fluent speaker or a logical floor talker.

The importation of a high-grade man by the utility to handle local disputes is poor policy, as it strikes the local people as a plan to talk them out of their side of the case by means of hiring an able lawyer. Instinctively the local people fall into an antagonistic mood. The manager, however, lives in the community and is one of the citizens and on a common basis with the local people from their point of view. Outside help can marshal the facts for the manager and obtain his material, but should not attempt to intervene directly in local disputes.

General publicity where there is no local dispute can be better handled by an able lecturer before civic bodies than in any other manner. A judicious use of newspaper advertising is also desirable.

NUMBER OF CUSTOMERS FOR REPORT PURPOSES

Pacific Power & Light Company Groups New and Lost Business Under Three Heads, According to Rate Schedule

Every installation that is billed under a separate rate schedule is counted by the Pacific Power & Light Company, Portland, Ore., as a customer in its monthly statistical report. Thus, a consumer having a lighting, power and range installation, although all on the same premises, is counted as three customers because each installation is billed under a separate rate schedule.

The company groups its new and lost business under the following heads: Class A business is secured when an additional load is added to an existing installation, and by installation is meant that load which is billed under any one rate schedule. Class B customers are secured when a load is connected where a similar service under the same rate schedule was rendered before. Class C customers are secured when a load is connected where similar service under the same rate schedule never was rendered before.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

The Commutator Machine as the Standard Single-Phase Type.—F. CREEDY.—The author cites advantages which could be realized through the universal employment of the commutator motor on single-phase circuits to the exclusion of the single-phase induction motor. He discusses the advantages of single-phase power over polyphase systems in certain districts and gives the relative costs, performance, weights and power factor of different machines. For variable speed it is desirable to vary both the auxiliary motor winding and the voltage from the transformer. In practice only three taps are provided on the motor winding and six on the transformer. By this means a sufficient number of combinations to give ten distinct speeds is provided, the field of the motor varying somewhat from the purely rotating character (which should theoretically be maintained) in the majority of these speeds.—*London Electrician*, April 19 and 26, 1918.

Elementary Principles of Continuous-Current Armature Winding.—F. M. DENTON.—The theory of equalizing connections is explained and rules are derived for the application of such connections. Chord winding is explained, and the use of interpolated commutator segments is discussed. Special consideration is given to the question of the number of slots that should be used for a given winding, taking into account the inductance of the parallel paths. The article concludes with a schedule of winding rules.—*London Electrician*, April 19 and 26, 1918.

Generation, Transmission and Distribution

National Electricity Supply in Great Britain.—The opinion is expressed that too great stress has been placed upon the saving of waste heat. Assuming that waste heat could be available generally as it exists around Tyneside, some 750,000 tons of coal per annum could be saved, which is only a small fraction of the 55,000,000 tons of saving promised. Furthermore, conceding that the £550,000 per annum might be saved by extensively utilizing waste heat, its importance is minimized when compared with the many millions to be expended. An important financial factor is the £210,000,000 initial cost to save 55,000,000 tons of coal per annum, and assessing the total capital charges at 8 per cent, there is an annual standing charge of £16,800,000 per annum, against a saving of £27,500,000 in coal.—*London Electrical Times*, April 25, 1918.

Utilizing the Escaping Steam at Coal Mines in Energy Production.—A. BARJOU.—First part of an article on this subject—an important one, the author holds, in view of the ever-growing use of electricity at coal mines. The problem consists of (1) the regulation of the steam escaping from the primary machines by its accumulation in a thermal or volumetric apparatus; (2) the utilization of this steam at low pressure by means of a turbine coupled to an electric generator;

(3) the attainment of as high a vacuum as possible to insure the performance and improve the output of this turbine.—*L'Industrie Electrique*, May 10, 1918.

Feed Water for Steam Boilers.—J. A. MONTELLIER.—The author estimates that when the incrustation caused to form on the sides of boilers by calcareous water reaches a thickness of 1 mm. (0.039 in.) it is necessary to increase combustion 10 per cent to get the same results as before any deposit was formed; if the thickness is 5 mm. or 6 mm., 40 or 50 per cent increase in combustion will be necessary. Eventually there is danger of an explosion. Cleaning the boilers is a long task which not only interrupts operations but also is likely to cause damage from the blows of the hammers. Feed water, the author says, ought not to contain too much of the salts of calcium and magnesium or too many organic substances. If it has more than 15 deg. of total hardness, it is essential to purify it. Practical directions for doing this are given.—*L'Industrie Electrique*, May 10, 1918.

Installations, Systems and Appliances

Switchgear Standardization.—CHARLES C. GARRARD.—Among the subjects discussed are the general principles underlying standardization, standard test pressure for switch and controlling gear, conductivity of current-carrying alloys, specifications for cast brass and gunmetal, millivolt drop at knife-switch contacts, and suggested standards for back-connection studs and nuts. The author calls attention to the urgent necessity of standard oil-switch rules in view of the conditions that exist in foreign countries and discusses breaking capacity, the connection between this and the quantity of oil required, the length of break and speed of operation. The millivolt drop at air-break circuit-breaker brush contacts is also considered; short-circuit tests, time element and determination of normal fusing current are subjects discussed in connection with cut-outs. Discussions regarding copper strip connections on switchboards, temperature rise, millivolt drop at bolted contacts, and lightning protective gears, including horn gaps, choke coils and lightning arresters, conclude the article.—*Journal of the Institution of Electrical Engineers*, London, April, 1918.

Rectification of Alternating Currents by the Corona.—The rectification of high voltage is an interesting problem on which some experiments described by J. W. Davis in a recent paper before the American Physical Society shed some light. Pressures as high as 42,000 volts have been rectified by the corona discharge in hydrogen. For a given gas pressure the maximum voltage which may be rectified is approximately proportional to the radius of the outer cylinder, provided that the inner cylinder is small compared with the outer. The rectification is practically perfect, but the efficiency is low, much energy being wasted in the discharge. The voltage at which discharge takes place may be con-

siderably reduced by arranging for the discharge to be started by an incandescent wire.—*London Electrician*, April 26, 1918.

Wires, Wiring and Conduits

Joining Triple-Concentric to Three-Core Cable.—P. WARDLE.—Description of a fitting which is not so bulky as those available heretofore. A 4-in. (10.2-cm.) sleeve will fit over the fitting.—*London Electrical Review*, April 26, 1918.

Heating of Conductors.—G. PERRIN.—A new method of calculating the maximum temperature that copper conductor can reach—an important consideration in the maintenance of insulation. The author, working out a numerical example, claims simplicity and rapidity for his method.—*Revue Générale de l'Electricité*, May 4, 1918.

Electrophysics and Magnetism

Resonance and Ionization Potentials for Electrons in Cadmium Vapor.—JOHN T. TATE and PAUL D. FOOTE.—The two types of electronic impact that take place with mercury also occur in cadmium vapor. The sudden decrease in current through the retarding field at an effective potential of 3.88 volts indicates a loss in energy of electrons having this critical velocity on impact with a cadmium atom. When the velocity of the electron corresponds to 8.92 volts, the collisions again become inelastic, and the sudden increase in the total current indicates that the loss in energy of the colliding electrons has disappeared in separating one or more of the electrons bound in the atom from the nucleus. That the entire spectrum of cadmium is probably radiated at potentials above 8.92 volts is indicated by the appearance of a visible glow around the hot wire at 9.2 volts. McLennan and Henderson were able to get the complete spectrum at about 15 volts. If, following McLennan, we calculate the ionizing potential on the basis of Bohr's theory, using the frequency $\nu = 1.5S$ of the cadmium spectrum ($\lambda = 1378.68A$) in the above relation, we obtain a theoretical value of 8.97 volts, as compared with 8.92 volts observed. The agreement is within the probable error of the experiment. The results obtained for the resonance and ionization potentials for electrons in mercury and cadmium vapors must be regarded as another very striking example of the fundamental accuracy of conclusions based upon Bohr's theory of atomic structure. Especially is this true of the results of mercury vapor, since for a long time the view that ionization took place at 4.9 volts, together with the known fact that the radiation emitted at that potential was monochromatic, formed a very serious obstacle to the complete acceptance of the theory of atomic structure.—*Paper No. 317, Bureau of Standards*.

Evolution of the Thermionic Value.—R. L. SMITH-ROSE.—The author refers to the investigations and findings of Elster, Geitel, Sir J. J. Thomson, Wehnelt, Edison, Fleming, Langnier and others. He concludes by saying that when a metal or carbon filament is rendered incandescent in a highly exhausted vessel there is a continual evaporation or emanation of negative electricity from it in the form of electrons, the rate of such emanation being dependent on the nature and temperature of the glowing filament and on the nature and pressure of the surrounding gas.—*London Wireless World*, April, 1918.

Miscellaneous

The Conservation of Platinum.—The Society of Expert Chemists of France is protesting against the employment of platinum in the manufacture of jewelry and silverware in view of its growing scarcity and its necessity in many manufactures of national importance, among which the electrical industry is prominent. The society desires either that such use be prohibited or that a heavy tax be levied on all articles of luxury containing platinum. In this connection the proposed substitutes for platinum—an alloy of gold and palladium, an alloy of nickel and chromium, an alloy of silicon and iron, quartz in its pure state and stellite—which were recently the subject of a paper read before the American Chemical Society by E. Haynes, are briefly dealt with.—*L'Industrie Electrique*, May 10, 1918.

Corrosion of Condenser Tubes Caused by Salt Water.—G. COSTESEQUE.—Central stations which get their circulating water from the sea have to contend with the corrosion of the condenser tubes. The author, who is the director of a power house at Marseilles, tells of his experiences during ten years, which show diverse and even contradictory results with identical condensers under the same conditions. He attributes the corrosion to electrolysis and has found that zinc disks through which a light current is allowed to pass have afforded a fair degree of protection.—*Revue Générale de l'Electricité*, May 4, 1918.

Purification of Boiler Water.—W. T. READ.—The article not only deals with the chemical and technical aspects of water purification but also gives, in plain and untechnical language, practical information and instructions for the benefit of those who are not conversant with chemical nomenclature and formulas. It is therefore valuable to every one interested in the purification of water for commercial purposes. Under the headings "Effects of Minerals in Water Used in Steam Boilers," "Common Scales in Boiler Water Supplies" and "What an Analysis Means and What It Does Not Mean," scaling, corrosion and foaming are very clearly discussed. Common chemical ingredients are given and statements are made when to use compounds, objections to compounds, mechanically acting compounds and legitimate compounds. Preheaters, water softeners and filters are also considered, mud and sludge removal, danger of incorrect filtration and coagulants being discussed. Under "Cost, Construction and Operation of Water Softeners" is listed the cost of standard patented water softeners. The variation of cost with size is pointed out. Under "Cost of Chemicals" the calculation of amount of chemicals needed for analysis of water, factors for use with hypothetical combinations and variations in cost of chemicals are given. The necessity for chemical control in an intermittent lime-soda softener is emphasized, and information is given on how to fix feed of chemicals to meet variations in water, use of one constituent to fix amount of chemicals, preparation of a table for amount of chemicals, how to determine bicarbonates, and apparatus and supplies for testing water. The reasons for testing, details of testing treated water and what the results mean are also discussed. The savings effected by water-softening plants, some general facts and some actual saving experiences with the Austin Street Railway Company softener are presented.—*University of Texas Bulletin* No. 1752.

Scientific and Industrial Research

A Department Devoted to Reports of Investigations Contemplated or Completed, Research Facilities Available, and Suggestions for Co-operative Work.

Conducted by PROF. VLADIMIR KARAPETOFF

Cornell University, Ithaca, N. Y.

Investigations Under Way or Completed (RESEARCH WORK REPORTED SINCE MAY 18)

[When investigations which have been completed are, in the opinion of the editors, of wide enough interest to the field we serve, details thereof will be presented in other parts of this paper. Contemplated research or that which appears to have limited appeal will be only briefly reported in this section, but details may be had by communicating with the investigator or institution named in the report. Readers are referred to the department "Technical Theory and Practice" for investigations reported in other journals. The news and engineering sections should also be followed for research reported before technical societies.]

FUEL CONSERVATION.

One of our larger problems is the conservation of petroleum and its products, as well as natural gas at the same time stimulating production and securing improved transportation to meet increased needs while avoiding waste. In the past eighteen months savings of from 20 per cent to 30 per cent have been effected by study of oil and gas problems and of gas made possible by special apparatus that heretofore was regarded as valueless. The processes now nearing completion in our refineries promise equal increases in fuel saving. We estimate that the work of our technical staff will show a saving of at least half a million dollars of crude-oil fuel in 1918 and nearly an equal amount in refiners.—H. B. Shaw, with Henry L. Doherty & Company, Toledo, Ohio.

LIGHTNING ARRESTER, ELECTRO-THERMAL.

The arrester, which is still in an experimental stage, consists of a bakelite tube containing two electrodes, one connected with the horn gap and the other with the ground. Normally the electrodes are connected by water, but when there is a discharge the vapor pressure generated forces the water out through a needle valve, breaking the circuit.—E. O. Schweitzer, Chicago.

PORCELAIN FOR SPARK PLUGS.

At the request of the Signal Corps and the National Advisory Committee for Aeronautics, the Bureau of Standards has undertaken a study of ignition problems with special reference to aeronautic engines. The investigation of spark plugs has involved the development of methods of testing the electrical conductivity of porcelain at high temperatures, the resistance to fracture of porcelain insulators by sudden changes of temperature and by mechanical impact, and the gas tightness of plugs at operating temperatures. Investigations of the characteristics of magnetos and other ignition systems are also being made to determine the relative characteristics of the spark discharges produced by the various systems. Much of the work is of a confidential nature and has, therefore, not been made public. A series of porcelains has been produced in the Pittsburgh Laboratory of the Bureau which show high electrical resistance at temperatures above red heat and at the same time good mechanical strength. Thus, at a temperature of 750 deg. C. one body showed a resistance of 1 megohm per centimeter cube.—Bureau of Standards, Washington, D. C.

RELAY, PROTECTIVE, ON THERMAL PRINCIPLE.

The relay is provided with a heating element the temperature of which increases in the same proportion as that of the piece of electrical apparatus to be protected. When the limiting temperature has been reached the relay causes the main circuit to be opened. In one form of relay a brass rod wound with asbestos-insulated magnet wire and an insulated casing are used. The expansion of the rod can be made to follow the dissipation of heat in any piece of electrical apparatus. To compensate for eddy currents a threaded iron screw is inserted inside the brass rod, upon which the asbestos insulated wire is wound. The expansive movement of the brass rod is multiplied by suitable levers in order to make and break a contact quickly. The disconnecting apparatus is a new form of polyphase magnet which has one axis for all the three phases and is active either on one, two or three of the phases.—S. N. Baruch, San Francisco, Cal.

STEEL, THE INFLUENCE OF HEAT TREATMENT ON ITS SPECIFIC RESISTANCE AND THERMO-ELECTRIC PROPERTIES.

The purpose of the investigation has been to add to the knowledge we have of the specific resistance and thermo-electric properties of steels of varying carbon content when these steels have been subjected to different heat treatments, and to point out the relation existing between specific resistance and chemical constitution, with a view to throwing more light on the underlying causes of hardness in steel. Experimental evidence shows that electrical resistivity in metallic solutions is an analogue of electrical conductivity in aqueous solutions, and consequently really a manifestation of the chemical constitution rather than of the purely physical structure.—E. D. Campbell, University of Michigan, Ann Arbor.

TRANSFORMER, SHORT-CIRCUIT, STRESSES.

A transformer under short-circuit was photographed by means of a moving-picture camera, to obtain information as to the process of the actual displacement and destruction of the coils. In preparing the positive of the film each element of the negative was printed ten times in succession, so that on the screen the motion of the coils appears slow enough for direct observation.—J. J. Frank, Pittsfield, Mass.

Suggestions for Research

DISTRIBUTION, MINIMUM-COST.

In view of the present high cost and scarcity of copper it would be advisable to make a study of the initial cost and operating expenses of some typical direct-current distributing systems with different distances between converter substations, for example, with substations 2 miles (3.2 km.) apart and again at a distance of 1 mile (1.6 km.) apart. In the first installation fewer generating units though of larger capacity would be required and fewer stations and switchboards. Against this saving there would be a greater amount of copper required in the distributing lines to obtain the same voltage regulation as would be obtained were smaller and more numerous units used. There are many existing installations in which a considerable amount of low-tension cable could be saved by adding more substations. The copper so salvaged could be used to advantage on other parts of the system.—E. C. Kincy, Columbus, Ohio.

FUSES.

The design of fuses is peculiar in that it is very largely an empirical proposition, there being a number of factors which probably have never been thoroughly and finally analyzed by either the manufacturers or engineers. This is due largely to the fact that the phenomena which take place, especially under severe short-circuit conditions, have so short a duration that they are unusually difficult to analyze. This is a fruitful field for an earnest student and a physicist to obtain definite laws, and to devise testing apparatus both accurate and reliable for practical use.—Editorial Suggestion.

FUSES.

The present holders for refillable fuses being made of fiber cannot be used in mines on account of moisture and atmospheric changes. Therefore research could be profitably carried on with the idea of producing either a material with which the fiber could be treated or a substitute for it.—P. L. Raymond, Chicago, Ill.

HEATING OF CONDUCTORS IN SLOTS.

With the increase in the rating of synchronous and induction machines it becomes of more and more importance to strand and otherwise to subdivide the conductors in slots so as to reduce the skin effect and eddy currents. But with a parallel connection of conductors less current flows through the conductors on the bottom of a slot on account of their greater inductance. Various methods have been proposed for the equalization of currents in order to reduce the copper loss and to increase the rating of the machine. It is desired that a systematic study be made of the various arrangements proposed and used from both the electrical and the mechanical point of view. See, for example, R. Richter in the *Archiv für Elek.*, 1917, p. 335, where he proposes to surround with a magnetic circuit the end connections of the conductors on top of the slots so as to increase their inductance and thus to force a proper share of the current through the bottom conductors.—Editorial Suggestion.

INSULATORS, ROD TYPE.

Some investigations regarding the effect of different-shaped terminals on the arcing voltage of a rod insulator (see the sketches) would be beneficial. The insulator would in practice have a rod made of wood impregnated with paraffine. For

experimental work, if such a rod was not available, one made of glass, porcelain, solid paraffine or hard rubber would probably do. Fig. 1 shows an insulating rod with close-fitting metal caps on the end, Fig. 2 the same rod with flat disks added to the caps, Fig. 3 a rod with curved disks on the caps, with convex surfaces opposite each other, and Fig. 4 the same thing with the disks reversed. If the minimum arcing distance is the same in all cases, what voltage would it take to arc over the different types of construction? I would suggest that the flat disks shown in Fig. 2 be made of different diameters, so as to determine at what point it would cease to be worth while to increase further the diameter of the disk in order to increase the voltage. The terminals shown on Figs. 3 and 4 could be made both of different diameters and different radii of curvature, and further variation could be made by making cone-shaped terminals. The points on the disks from which the arc starts are also important, as it is desirable to have the arc jump from the outer edges of the disk rather than to follow the surface of the rod.—H. H. Cochrane, Montana Power Company, Butte.

LIGHTNING PROTECTION.

Some experiments indicate that the amount of atmospheric electricity which a lightning rod can conduct to the ground may be increased many times by artificially ionizing the air around the point. This artificial ionization may be produced by several known means such as radio-active substances, ultra-violet light, an electric spark, etc. Further laboratory experiments are desired with a view to developing practical arrangements for the protection of oil tanks, powder magazines and similar structures against lightning. The use of some inexpensive radio-active substance seems especially promising.

STARTERS FOR DIRECT-CURRENT MOTORS.

Valuable work could be done in determining the proper number of accelerating points and the relative value of the resistance steps to be used in connection with automatic starters for direct-current motors. Any information that could be tabulated or any empirical formulas that could be devised for this purpose for different makes and speeds of motors would be of considerable benefit.—H. L. Van Valkenburg, Milwaukee, Wis.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

ADDITION TO PROGRAM FOR A. I. E. E. ANNUAL CONVENTION

Several Papers Not Previously Announced to Be
Presented at the Atlantic City Meeting on June
26-28—Luncheon-Conferences

Besides the list of papers announced in the March 16 issue of the ELECTRICAL WORLD for the thirty-fourth annual convention of the American Institute of Electrical Engineers, R. E. Dougherty and O. E. Shirley will present a paper on "Reactance of Synchronous Machines and Its Application," and J. M. Drabelle and L. M. Bonnett will present one on "The Automatic Hydroelectric Plant."

Crosby Field, Ordnance Department, U. S. A., will read a paper on the same subject as that by Dr. C. P. Steinmetz, "The Oxide Film-Fighting Arrester."

At luncheon on the three days of the meeting there will be conferences of Institute officers and delegates of sections and branches. The board of directors will hold a meeting at 5 p. m. on June 26, and in the evening there will be an informal reception and dance. Technical committee reports will be read at the first session, opening 10.30 a. m. on Wednesday.

PLAN OF CONTRACTOR-DEALER CONVENTION AT CLEVELAND

First Annual Meeting of the Association Under Its
New Name and Object—All Executive and
General Meetings Open to All

The eighteenth annual convention of the National Association of Electrical Contractors and Dealers will be held at Cleveland July 15 to 20 with headquarters at the Hollenden Hotel. Monday, July 15, will be given over to the meetings of the national executive committee, and on Tuesday afternoon there will be meetings of the Atlantic, Central and Pacific divisions.

The convention will be opened at 10 o'clock on Wednesday, July 17, by A. L. Oppenheimer, president of the Electrical Contractors of Cleveland. An address of welcome by Mayor Davis of Cleveland will be responded to by President W. C. Peet. There will also be an address by W. C. Rose, president of the Cleveland Advertising Club. On Wednesday afternoon L. K. Comstock, New York, will present a paper on "Scientific System of Wage Adjustment," to be followed by a round-table conference on the labor cost data, J. N. Pierce being chairman.

On Thursday morning J. R. Strong, past-president of the association, will speak on organization and William L. Goodwin will describe the Goodwin plan. On Friday morning, following reports of the association committees, G. M. Sanborn of Indianapolis will read a paper on "How to Open a Retail Store," to be followed by another paper on "How an Electrical Contractor Can Become a Successful Retailer." The question box will be

opened and questions will be answered by Mr. Goodwin.

All sessions of the convention, as well as the meetings of the national executive committee and division meetings, will be open to any one wishing to attend. On all papers read before the convention a free and open discussion is invited.

STEP TAKEN FOR RELIEF OF POWER SHORTAGE IN CALIFORNIA

Utilities Meet with Commission and Agree on Plan
Involving Pooling of Power, Priorities and
Postponed Financial Adjustment

The California Railroad Commission called together on Tuesday representatives of all power companies now interconnected in the central California group to consider means of relief from the present power shortage.

Mortimer Fleishhacker, Great Western Power Company, after reviewing the causes of power shortage, suggested that the commission prepare a priority list of classes of consumers which would be used alike by all power companies. Paul M. Downing, Pacific Gas & Electric Company, also assured the commission that serious power shortage actually exists and that immediate action is necessary. Either certain consumers must be shut off entirely or the amount of power supplied consumers of certain classes must be reduced. The State Food Administrator and Emergency Fleet Corporation representatives predicted a large increase of power demand for irrigation pumping and ship construction respectively.

The commission then examined power company representatives successively, with the result that each agreed to three general features of a plan for relief; namely, first, pooling all available power; second, apportioning load in accordance with a priority rating to be prepared later, and third, postponing the incidental financial adjustment between companies until the physical results shall have been accomplished.

Representatives of the several power companies, at the commission's suggestion, then and there elected a committee of seven to act with the commission in taking steps to relieve the present crisis in such way as may be deemed best. A. E. Schwabacher, State Fuel Administrator; D. M. Folsom, Pacific Coast Petroleum Administrator, and a representative of the Federal Reserve Bank heartily indorsed the plan and agreed to cooperate. The commission then immediately went into session with the committee of seven, of which the members are: A. Casper, Vallejo Light & Power Company; Samuel Kahn, Western States Gas & Electric Company; John A. Britton, Pacific Gas & Electric Company; Mortimer Fleishhacker, Great Western Power Company; Edward Whaley, Northern California Power Company; H. F. Jackson, Sierra & San Francisco Power Company, and S. W. Coleman, Coast Valleys Gas & Electric Company.

INDUSTRIAL EFFICIENCY

AT A. S. M. E. CONVENTION

War Topics Predominate in Important Meeting at Worcester, Mass., Attended by Nearly 1000 Delegates and Guests

American industry is humming with a determination to force the Hun back through efficient co-operation with the men on the fighting fronts. The importance of the engineer's work behind the lines in productive service was emphasized over and over again at the spring meeting of the American Society of Mechanical Engineers held at Worcester, Mass., June 4 to 7, and the influence of the war upon the papers and discussions of nearly 1000 members and guests who attended the convention was apparent at every session. In munitions production, in the efficient use of fuel and in numerous other ways the engineers of America are accomplishing a superb task, whose magnitude could only be hinted at in the crowded hours of the meetings.

The opening session took place on the evening of June 4 at the Hotel Bancroft, greetings being extended by R. Sanford Riley, president of the Worcester Chamber of Commerce, and by Mayor P. G. Holmes of Worcester. A council meeting of the society was held in the afternoon, with President Charles T. Main in the chair. At this session resolutions were discussed relative to the elimination of the alien enemy members of the society, of which there are about 100 out of a total membership of 9000. It was decided to draft suitable resolutions and present them for consideration at the winter meeting of the society in New York.

Regular activities opened Wednesday with a business session at the Worcester Polytechnic Institute. A forty-eight page report was presented by the committee on limits and tolerance in screw-thread fits. This was followed by a report by the committee on weights and measures, a forty-eight page compilation of replies to a questionnaire regarding the use of the metric system by several thousand manufacturing concerns in the United States. The replies indicated that the metric system is not making great progress in this country.

Following the reports, Prof. George H. Haynes, head of the department of economics, Worcester Polytechnic Institute, read a suggestive paper on "The Small Industry in a Democracy." Dr. Haynes emphasized the value of team play to industry, pointing out how it is obtained in small establishments through direct relationship between employer and employee.

President Ira N. Hollis of the Worcester Polytechnic Institute, past-president of the A. S. M. E. and chairman of the New England Fuel Administration's engineering advisory committee on plant economy, made an address on the importance of fuel conservation through co-operative effort.

H. W. Ballou, consulting engineer, Providence, R. I., presented a paper on the "Use of Fuel Oil in New England Power Plants," which gave a statistical tabulation of installations of this type. Within four years sixty plants have adopted fuel for 344 boilers of ten different kinds, totaling 83,000 hp. One-half of these are in Rhode Island. The rapid adoption of fuel oil, the author stated, is due to its superiority to coal in all attributes except possibly that of first cost. Despite the great advantages of fuel oil, the increasing shortage threatens its future use, and the author predicted that

in time oil fuel will command a premium for marine use which will commercially debar it from the power plants of New England. In many cases, however, the whole cost of the oil-burning installations will be saved well within a period of five years.

A report of other proceedings of the convention will be published in a later issue.

COAL DEFICIT THREATENS

TO CAUSE FAMINE IN FUEL

"We Know the Worst of a Bad Situation," Says the Fuel Administration—Conservation the Only Safe Way

A statement on the critical coal outlook issued by the Federal Fuel Administration on June 10 says in part:

The fuel budget for the season 1918-1919 has been completed by the United States Fuel Administration. We know the worst of a bad situation. A detailed survey of the coal required during the present coal year for war purposes to keep our industries running and for domestic consumers foots up about 80,000,000 tons more than was produced last year. This is the figure on June 1. . . .

It is estimated that the industries not employed on war work will require something less than 100,000,000 tons of coal. All consumers of fuel, war industries and otherwise, must participate in the saving campaign, but non-war industries are especially interested, because whatever the deficiency turns out to be, it will come out of their quota. Hence, the general prosperity of our industries and the full employment of labor will depend upon saving, by economies and prevention of waste, between 50,000,000 and 60,000,000 tons.

In spite of intense efforts to increase the production of coal, the first five months of 1918 have produced only 10,000,000 tons in excess of the same period of 1917. If this is considered in relation to the immense physical task involved in producing 12,000,000 tons of coal per week, it is easy to draw the conclusion that this increased demand of 100,000,000 tons cannot to any large extent be met by increased production. And yet an actual deficit of 500,000 tons would mean a personal privation and an industrial disaster which no one can contemplate with equanimity.

What is the answer? There is only one; it is saving coal. It is the answer Europe has made in a similar situation—saving coal in every possible way and by all of the people.

The Fuel Administration has foreseen the situation represented by these figures and through its conservation division has organized fuel-saving campaigns reaching out into every department of our national life where fuel is consumed.

Fuel economy is receiving intensive study in connection with steam plants and industrial uses. An organization is already in existence provided with engineers and inspectors who will visit every one of the 250,000 steam-producing plants in the country with a view to the improvement both of equipment and firing practice. This is expected to save 20,000,000 tons of coal. The economical use of power in factories will be in the hands of organized shop committees. The power loads of the public utilities throughout the country are being studied with a view to readjustments which will result in large saving.

In many cities the isolated power plants which use an extravagant amount of coal in proportion to the power produced will be urged to obtain more economical power from large producing stations.

The introduction of "skip-stop" schedules on all the street railways is expected to save 1,000,000 tons of coal. The consolidation of ice plants will yield a still larger tonnage. Unnecessary outdoor lighting, including advertising signs and display illumination, will be reduced. Hotels, office buildings, apartment houses and public buildings are being asked to join in rigid economy of light and heat.

Every American citizen will be asked to clean his furnace, keep it in repair and study economical firing. Instructions prepared by the highest authority will be furnished by the Fuel Administration.

If every one joins in this movement from the owner of an industrial plant to the householder with his furnace and cookstove, if indoor and outdoor lighting is reduced to the amount absolutely needed, if houses are not overheated, the furnace dampers properly adjusted and the ashes sifted, it will be possible to save from 50,000,000 to 75,000,000 tons of coal without serious inconvenience to the American people.

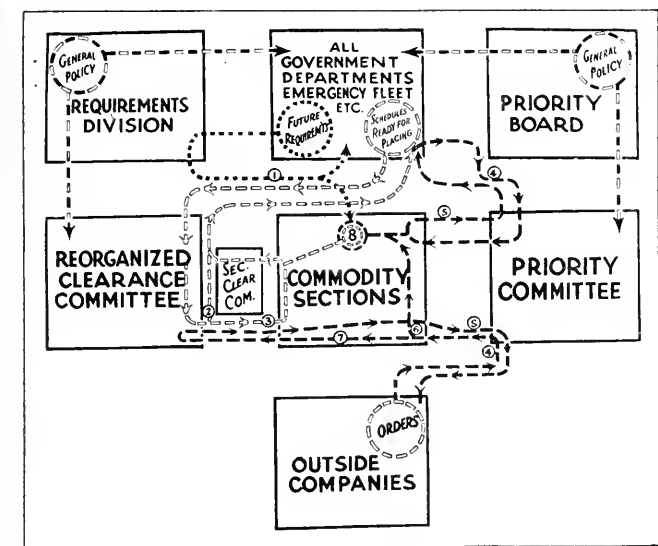

A saving of 60,000,000 tons of coal is the one possible avenue of escape from national disaster. Necessities of war must be supplied. The coal deficit must inevitably come out of the necessary fuel for non-war industries. These industries employ millions of our population and furnish the backbone of our national wealth. Factories will shut down and men be out of work in proportion to the coal deficit. Every ton of coal saved will keep fifty workmen from idleness and permit an additional creation of several hundred dollars' worth of national wealth.

The Fuel Administration has frankly given to the public statistics of an alarming fuel situation. It desires to state just as frankly and with all the emphasis possible that it is in the power of the American people through fuel economy to save the country from the effects of the fuel famine.

ECONOMIZING TIME IN WAR INDUSTRIES BOARD

Diagrams Presented by Walter Robbins Before the
Electric Power Club Show the Methods
Followed in Washington

Walter Robbins, chief of the power equipment section of the finished products division of the War Industries Board, presented the accompanying diagrams in connection with his remarks on war service work at the annual meeting of the Electric Power Club, Hot Springs, Va., on May 30 to June 1.

INTERRELATION OF WAR INDUSTRIES BOARD DIVISIONS

Here is a key to the numbers on the first diagram:

1. Requirements are presented in person by a representative of the department or organization in interest, who of course learns at the meeting whether they are approved or not. If approved, copies are sent to all commodity sections that may be directly or indirectly interested.
2. If the commodity representative is able to clear at the meeting, the proposal goes back with the representative.
3. When the commodity section having jurisdiction over the article in question is unable to offer immediate clearance, but must arrange clearance by negotiation with outside companies and all other departments whose work might be interfered with, then the requirement is taken back to his office for such study, and when ready for clearance is not

again presented at committee meeting, except in special cases, but is passed to the secretary for proper record.

4. Upon reaching priority division the application is numbered and recorded. All correspondence thereafter indicates the application number, the name of the specializing member is indicated upon the application, and it then passes to the proper commodity section for recommendation.

5. Upon return with recommendation the case is reviewed by the specializing member, with the sub-committee on rat-

GENERAL CLASSIFICATION OF PURPOSES DEMANDING PREFERENCE TREATMENT

SHIPS	Including destroyers and submarine chasers
AIR CRAFT	
MUNITIONS, MILITARY AND NAVAL SUPPLIES AND OPERATIONS	Building construction for Government needs Equipment for same
FUEL	Domestic consumption Manufacturing necessities named herein
FOOD AND COLLATERAL INDUSTRIES	Foodstuffs for human consumption and plants handling same. Feeding stuffs for domestic fowls and animals, and plants handling same All tools, utensils, implements, machinery and equipment required for production, harvesting and distribution, milling, preparing, canning and refining Foods and Feeds, such as seeds of Foods and Feeds, Binder Twine, etc. Products of collateral industries, such as Fertilizer, Fertilizer ingredients, insecticides and fungicides, Containers for foods and feeds, collateral products Materials and equipment for preservation of Foods and Feeds, such as Ammonia and other refrigeration supplies including ice
CLOTHING	For civilian population
RAILROAD	For other necessary transportation equipment, including water transportation
PUBLIC UTILITIES	Serving war industries, Army, Navy and civilian population

Including all necessary raw materials, partially manufactured parts and supplies for completion of products

ing, or taken to the meeting of the entire committee as circumstances may warrant.

6. Application may return immediately to priority committee if the commodity section is in position to make immediate recommendation without further investigation or consultation.

7. Original contact with secondary requirements frequently comes through priority application. It is the duty of commodity sections to watch for interferences, and when they cannot be removed by discussion with departments they are taken by the commodity representative on clearance committee to the meeting and then referred with recommendation as shown under No. 5.

8. Very often, upon the original appearance of the requirement clearance, priority recommendation and clearance of the secondary requirements can all be arranged in a single conference between the department or departments interested and affected, the specializing member of the priority committee and the commodity chiefs who may be interested, and procedure is arranged for clearance and for priority action when the priority application or applications actually appear through route No. 4.

MIDDLE WEST SUBSIDIARIES ANTICIPATE RATE INCREASES

Already \$400,000 of Increases Have Been Granted, and Applications for \$600,000 Additional Are Pending—Scrip Dividend

In mailing its first scrip dividend the Middle West Utilities Company, Chicago, by order of the directors and over the signature of Samuel Insull, president, made a statement of the financial position and future prospects of the company, in part as follows:

The very unfavorable condition of the securities market brought about by government needs makes the raising of funds for the natural necessities of a constantly increasing gross business difficult, even at excessive rates of interest. Directors therefore decided to pay the preferred stock dividend in ten-year 6 per cent interest-bearing certificates. Interest on these is payable quarterly or at such other periods as may be determined from time to time by the directors. The company at its option at any time before maturity may pay the principal with accrued interest then unpaid upon giving at least ninety days' notice. The holder at his option may convert certificates aggregating \$100 or any multiple at any time prior to payment into preferred or common stock at par.

In the twelve months ended March 31, 1918, the aggregate gross income of the company's subsidiaries was \$1,500,000 greater than for the preceding twelve months. Operating expenses for the same period increased \$1,670,000. The increase in gross income for the three months ended March 31, 1918, as compared with the corresponding period of 1917 was \$328,000. Operating expenses increased \$400,000 for the same period, owing largely to the fact that January was a most unfavorable month for all utilities because of unusually severe weather conditions and the governmental regulation with relation to heatless days. By reason of increased operating expenses the balance over preferred stock dividend will be somewhat less in the annual report for the fiscal year ended April 30 than in the previous fiscal year.

Some of the subsidiaries of the Middle West Utilities Company have already obtained by increased rates for service and by increasing the selling prices of other products increases aggregating over \$500,000 per year. The larger part of these increases has not yet been reflected in their earnings. As of January 1, 1918, only \$160,000 per annum had become effective, while as of May 1, 1918, this amount was increased to \$400,000 per annum.

In addition other subsidiaries now have before the various commissions applications for increases approximating a further amount of \$600,000, making increases of rates secured and anticipated amounting in the aggregate to upward of \$1,000,000. The management feels that with operating conditions no worse than in the year previous and with the increases now effective and those to be obtained by the subsidiaries within the next few months from applications pending the net earnings of the Middle West Utilities Company for the fiscal year starting May 1 will be satisfactory.

CHICAGO TECHNICAL MEN ARE UNITED FOR WAR WORK

Engineering and Technical Societies in That City Organize a Joint War Committee to Combine Strength and Resources

Representing an effort to co-operate effectively and vigorously for war work, an important joint war committee has been formed by representatives of technical societies centered in Chicago. The movement was started by the military committee of the Western Society of Engineers. As the result the "War Committee, Technical Societies of Chicago," has been organized.

The purpose of this organization is "to enable the technical societies of the Chicago zone to call into play the efforts of the members of the various societies herein represented as occasion may arise, and to co-ordinate their activities in the most effectual manner to help win the war." It is proposed to place at the disposal of the United States government and other authorized agencies the combined strength and resources of the Chicago technical societies for war work as need may arise. The following member societies are co-operating: Western Society of Engineers, Structural Engineers' Association of Illinois, Society of Industrial Engineers, Illinois Society of Engineers, Illinois Society of Architects, American Railway Engineering Association, Swedish Engineers' Society of Chicago, Illinois Chapter American Institute of Architects, Chicago Section American Society of Mechanical Engineers, Chicago Section American Institute of Electrical Engineers, Chicago Section American Chemical Society, Chicago Section American Institute of Mining Engineers, Mid-West Section Society of Automotive Engineers, Illinois Association of American Society of Civil Engineers, Chicago Section American Society of Heating and Ventilating Engineers, Chicago Section American Society of Refrigerating Engineers, Chicago Section Steel Treating Research Society, Chicago Section Illuminating Engineering Society and Chicago Chapter American Association of Engineers.

Officers of the war committee have been elected as follows: Chairman, F. K. Copeland; vice-chairman, W. L. Abbott; secretary, Edgar S. Nethercut; treasurer, William A. Fox.

The executive committee consists of F. K. Copeland, W. L. Abbott, William Hoskins, C. A. Keller, Charles E. Lord, C. F. Loweth, Isham Randolph and Richard E. Schmidt. The address of the secretary of the war committee is 1735 Monadnock Block, Chicago.

HOW TO WIN THE WAR

What we need to do is to speed up. It is not a question of what we must not do but a question of what we must do. We must win the war. We must provide all the arms, ammunition, ordnance, aeroplanes and other equipment that can be transported to Europe, and we must build ships as rapidly as possible.

We must make all the other goods that we can possibly make. We must keep on creating new wealth. We must keep our manufacturing organization in good running order. We must continue to go after foreign trade. And we must prepare ourselves for the intense competition for foreign markets that will occur after the war.

THOMAS A. EDISON.

(Letter read at Edison phonograph convention.)

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

N. E. L. A., Connecticut Section.—The fifth annual outing of the Connecticut Get-Together Club of the National Electric Light Association is scheduled for to-day (June 15) at the Momauguin Hotel, Cosey Beach, East Haven, Conn.

A. S. M. E., Indianapolis Section.—L. W. Wallace was elected chairman at the May 10 meeting of the Indianapolis Section of the American Society of Mechanical Engineers. "Heat Losses in Uncovered Steam Pipes" was the subject of discussion.

Engineering Society of Milwaukee.—H. M. St. John of the Testing Laboratory of the Commonwealth Edison Company, Chicago, gave an illustrated talk on "Products of Electric Furnaces and the Cost of Their Production" before the Engineering Society of Milwaukee on June 12.

A. I. E. E., Pittsburgh Section.—At the final meeting of the season of the Pittsburgh Section of the American Institute of Electrical Engineers, on June 11, Major Lyle spoke on "The Department Organization of a Modern Army" and S. Q. Hayes spoke on "Some Recent European Experiences."

Chicago Vehicle Association.—The Chicago Electric Vehicle Section, National Electric Light Association, has elected the following officers for the ensuing year: President, George D. Foster, Commonwealth Edison Company, and secretary-treasurer, E. W. Swift, Commonwealth Edison Company.

Electrical Club of Detroit.—Dr. A. C. Studar talked before the Electrical Club of Detroit at its regular weekly luncheon on June 1 on "The Y. M. C. A. and the War." The June 1 number of *Current Events*, issued weekly by the club, is dedicated to the Detroit Edison Company and called the "central-station edition."

N. E. L. A., Public Service Section.—The June meeting of the Public Service Section of the National Electric Light Association will be held in the assembly room of the Terminal Building, Newark, on Monday evening, June 17, at 8 p. m. There will be an election of officers and a discussion about the different departments.

A. I. E. E., Cleveland Section.—C. S. Ripley was elected chairman and R. K. Knowles was elected secretary at the May 20 meeting of the Cleveland Section of the American Institute of Electrical Engineers. This was the last meeting of the season and was held under the auspices of the committee on co-operation of engineering societies. It was addressed by C. E. Drayer, secretary of the national committee on co-operation.

Synchronous Club of Los Angeles.—"Electric Railways" was the subject of a lecture delivered by L. J. Turley of the Los Angeles Railway Corporation before the June 6 meeting of the Synchronous Club of Los Angeles.

A. I. E. E., Madison Section.—James W. Watson and L. E. A. Kelso of the University of Wisconsin were elected chairman and secretary respectively at the May 27 meeting of the Madison Section of the American Institute of Electrical Engineers. E. R. Shepard of the Bureau of Standards gave an address on "Electrolysis and Mitigation Methods." He first gave a short illustrated talk on the work of the Bureau of Standards.

A. I. E. E., Chicago Section.—The Chicago Section of the American Institute of Electrical Engineers, at its meeting on May 27, elected the following officers for the ensuing year: Chairman, C. A. Keller, and secretary, A. F. Riggs. On June 17 the section will hold a joint meeting with the Western Society of Engineers, at which time there will be a discussion of the economies which can be derived from the use of higher steam pressures.

Empire State Gas and Electric Association, Electric Section.—A meeting of the Electric Section of the Empire State Gas and Electric Association will be held in the Onondaga Hotel, Syracuse, N. Y., on Friday, June 21, at 9.30 a. m. This will be a combined meeting of the electric production and the electric distribution departments, and war-time topics will be discussed. Among these topics will be the labor situation and the substitution of women for men, fuel conservation, 11,000-volt distribution with special attention to connecting transformers and to protection from lightning in connection with rural service, the rear-lot distribution in residence districts, outdoor-substation design and construction, electric furnace operation and its effect on system regulation, and the installation and maintenance of synchronous motors on consumers' premises to improve the power factor on the distribution system.

Ohio Electric Light Association.—As previously announced in the *ELECTRIC WORLD*, the twenty-fourth annual convention of the Ohio Electric Light Association will be opened on Wednesday, July 10, at 10 a. m. at the Breakers Hotel, Cedar Point, Ohio. On that day, besides the president's address, there will be a report of the executive committee, secretary-treasurer's report, report of the illumination committee, appointment of committees, report of the station and operating committee, and report of the meter committee. Thursday morning there will be reports from the new-business co-operations committee, the commercial lighting and merchandising section and the industrial power and heating section. In the afternoon James M. Cox, Governor of Ohio, will deliver an address. On Friday there will be a report of the transmission and distribution committee and election of officers. Beecher W. Waltermire, Public Utility Commissioner of Ohio, will speak.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Discretion of Commission Regarding Rehearings.—Under the Public Service Commission law providing that, on application for rehearing of a proceeding, the commission shall grant and hold such a rehearing if in its judgment sufficient reason is made to appear, the granting or refusing of application for rehearing rests in the discretion of the commission, the New York Supreme Court held (169 N. Y. S. 953).

Rights to Use of Streets.—Where an illuminating and heating company had laid its conduits in a public alley, a contractor, excavating a basement on the land of an abutting owner, had no right to excavate part of the alley so as to cause a cave-in, resulting in injury to such conduits, and was liable for the resulting damage, the Supreme Court of Michigan held in *Edison Illuminating Company versus Mich* (166 N. W. 944). The requirement in a franchise to a lighting and heating company that it get an express permit to lay its conduits in a public alley, being for the protection of the city, might be waived by it, and failure to obtain such permit constitutes no defense in an action by the company for injuries to its conduits.

Secondary Municipal Franchises.—The right of a public service corporation to hold and enjoy a secondary franchise granted by a municipal corporation and conferring privileges and rights within the limits of the city, town or village that can be exercised only by its permission depends upon the continuous performance of the public duties assumed by the acceptance of the franchise, constituting a condition precedent to such right, it was held by the Supreme Court of Appeals of West Virginia (95 S. E. 6531). On the failure of such performance the right or privilege granted by the franchise terminates, and a court of equity has jurisdiction to cancel the franchise, by way of rescission of the contract between the granting and accepting corporations. A telephone company holding a franchise for the installation, maintenance, and operation of one telephone system in a city, town or village cannot without the consent of such municipal corporation take over by purchase another system constructed by another company under another franchise and operate both systems separately and contemporaneously, nor use the locations of such other system in the streets for wires and other appliances of its own system, nor take the benefit of other privileges granted to such other company, without having acquired its franchise as well as its tangible property.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Using Electric Light in Gas Works.

According to an item in a Richmond (Va.) newspaper, the superintendent of the city electric plant in that place is about to wire the gas works in order to permit electricity to be used for lighting them.

Spokane Extension Plans Abandoned.

It is announced that, owing to war conditions, the Spokane (Wash.) Heat, Light & Power Company will not extend its lines into the residential district this year, as had been intended. Minor adjustments and small extensions to hold the present field are to be made, but no new patrons sought.

State Franchise Tax Paid Under Protest.—At the recent convention of the Missouri Public Utilities Association the fact was brought out that a number of companies in Missouri are paying a state franchise tax under protest. It was also stated that this course was followed after a careful investigation had been made and legal counsel secured.

Kansas Rate Increase.—The United Water, Gas & Electric Company, Hutchinson, Kan., has been given authority by the Kansas Public Utilities Commission to add a surcharge of 3 mills per kilowatt-hour to all existing electric power rates and for energy supplied for electric ranges and battery-charging services. This will add 13 per cent to the gross earnings.

Rate Increase Granted in St. Joseph, Mo.—The Missouri Public Service Commission has granted authority to the St. Joseph Railway, Light, Heat & Power Company to increase all lighting rates to 9 mills per kilowatt-hour, which will mean an increase in lighting revenue of \$8,000 a month. The appeal for this increase was made two months ago. The company had previously received an increase in power rates.

Air Attack on Power House in the Trentino.—According to the London Times a squadron of Italian and British airmen flew on May 4 to Cavedine, which lies to the northeast of Riva (in the Trentino) and dropped such a weight of explosives on the celebrated hydroelectric power house that it will be some time before the supply can be resumed. The central station was actually seen to be destroyed. The raiders flew in four rotating groups, and it is stated that the attack lasted from 8 a. m. till midday. An important effect of the raid, it is said, will be a complete shut-down of the electric railway from Trent up the Val di Sole to Fucine, which is a valuable link in the Austrian army's communications.

Technical Men Needed for War Work.

Those who cannot take part in the actual fighting in France may find an opportunity to help in numerous technical positions under the War and Navy Departments, which are seeking trained men. The army and navy would be powerless without the backing of an efficient corps of highly trained men working in connection with the production of war material. The United States Civil Service Commission, whose duty it is to recruit the civilian army, announces that the government is in urgent need of large numbers of specialists to promote the war program.

Engineering Foundation Board Members.—At a regular meeting of trustees of the United Engineering Society this election was made to the Engineering Foundation Board: Calvert Townley, Westinghouse Electric & Manufacturing Company, New York, succeeding Gano Dunn. The following are additional members: Silas H. Woodard, consulting engineer, American Society of Civil Engineers; Dr. Joseph W. Richards, professor of metallurgy, Lehigh University, South Bethlehem, Pa.; Dr. David S. Jacobus, advisory engineer, Babcock & Wilcox Company, New York; H. Hobart Porter, Sanderson & Porter, consulting engineers, New York.

Course in Radio Communication.

On account of the urgent need of the government for men qualified to render special technical service in the Signal Corps, the University of Illinois will offer a course in radio communication during the summer session of 1918. This course is for men who wish to prepare themselves for research and development work or for field service in the Signal Corps of the army. Instruction will begin Monday, June 17, and will continue until Aug. 9. The assigned work will require the full time of the student registering. University credit of eight semester hours will be granted those who successfully complete the work. This course is planned for those who have completed two years of work in the College of Engineering of the University of Illinois or the equivalent. It is especially important that those who register should be well grounded in physics and in mathematics, including differential and integral calculus. The physical and mathematical theories underlying the phenomena of radio-telegraphy and radio-telephony will be presented in the class room through lectures and recitations on assigned work and through experiments performed in the radio laboratory. Use will be made of information furnished by the government concerning radio apparatus used in the army at the present time. In addition to the radio apparatus belonging to the university, there is available apparatus which has been loaned by the government for instructional purposes. For this reason the course is open only to citizens of the United States, and each one registering will be expected to take oath before a notary public binding himself not to misuse in any way information which may be received.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Rate Increase in Illinois.—In allowing the Alton Gas & Electric Company to increase rates the Illinois Public Utilities Commission holds that where a utility has abandoned its steam generating plant and purchases electrical energy from an affiliated company under a contract entered into prior to the increase in operating expenses, the purchase price will not be accepted as the rate base to the exclusion of the increased costs. In view of the facts of the particular case, the commission adjusted rates to meet increased operating expenses without requiring a valuation of the property where the utility had abandoned its generating plant and purchased its energy from an affiliated company.

Deposit for Service.—According to an opinion of Commissioner Corey of the Oregon Public Service Commission, the Portland Railway, Light & Power Company can no longer compel patrons of its electric lighting service in Portland to sign a three-year contract for service or a one-year contract with a deposit of \$3 attached. The commission holds that no more than a sum sufficient to furnish adequate security for the credit extended may be legally exacted. The commission believes that a deposit equal to the estimated maximum sixty-day bill is justified, or that a satisfactory guarantee should be asked. After a cash deposit guaranteeing payment for metered service has stood unimpaired for twelve months, thus reasonably establishing credit, the deposit should be returned with interest, according to the decision of Commissioner Corey.

Crossing Railroad Property.—A decision of the Pennsylvania Public Service Commission affecting the Butler Light, Heat & Motor Company says that the public service law is regulatory and not designed to enlarge powers of public service companies. The applicant proposes to furnish its product to a coal-mining operation, which necessitates crossing the tracks and property of the protesting railroad company. The crossing proposed consisted of eight high-voltage wires carried on wooden supports over the property of the railroad company, on which are four tracks and admittedly heavy traffic. The railroad company protested, alleging that the electric company was not authorized by law to cross its tracks, and that the crossing in the manner proposed was dangerous for its operations. The commission held that the crossing at the point and in the manner proposed was dangerous to the traveling public and beyond the power vested in the electric company by its charter.

Herbert Bellamy, president-elect of the Iowa Section, National Electric Light Association, is secretary and manager of the electric light department of the Marion County Electric Company, Knoxville, Iowa. This company and its predecessors were organized by Mr. Bellamy's father in 1887 as one of the first electric utilities in Iowa. Mr. Bellamy was graduated from Cornell College, Mount Vernon, Iowa, in 1906 and since that time has

HERBERT BELLAMY

been almost continuously engaged in public utility work at Knoxville, where his company has not only the electric light and power utility but also the telephone company.

William A. Magee, Pittsburgh, Pa., has been appointed a member of the Pennsylvania Public Service Commission. Mr. Magee was formerly Mayor of Pittsburgh.

Dr. A. E. Kennelly of Cambridge, Mass., acting head of the department of electrical engineering at the Massachusetts Institute of Technology, has been commandeered by the authorities in Washington for special work during the summer months. His position is that of civilian liaison officer to the Signal Corps, and his duties will be in line with his special attainments. He will be away from the institute during the summer months, but expects to report back in the fall. In his absence Dr. F. A. Laws will care for the direction of the special school for radio-engineers.

M. K. Arenberg, formerly a specialist in the supply department of the General Electric Company, who completed a course at the United States Naval Training Station, Great Lakes, Ill., after passing an examination was made chief petty officer in the United States Navy. Two months ago he was sent to the officers' material school, where he was commissioned as an ensign. He is at present under orders to report to Annapolis for a four months' course of training. Mr. Arenberg was also formerly in the employ of the Ilg Electric Ventilating Company, Chicago, as a ventilating engineer.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

Oscar S. Straus has resigned as chairman of the Public Service Commission for the First District of New York to become associated with the National Food Administration at Washington, where he will investigate sugar costs and profits.

Charles H. Smith, an engineer of the executive department of the Westinghouse Electric & Manufacturing Company, has received a commission as major in the Reserve Engineers and has gone to Camp Lee to enter the engineering school, where he will receive further instruction. Major Smith is a veteran of the Spanish-American war, in which he served as a captain.

F. F. Espenschied has resigned as assistant engineer for the Hydro-Electric Power Commission of Ontario to become connected with the Combustion Engineering Corporation, New York City. Prior to going to Canada he was general manager of the Interstate Light & Power Company, Galena, Ill., having formerly been engineer with the West Penn Power Company at Connellsville and Pittsburgh, Pa. Mr. Espenschied was graduated from Cornell University in 1905 in mechanical engineering.

Hugh H. Harrison, who has been president of the Merchants' Heat & Light Company of Indianapolis for the last four and a half years, has resigned, effective at once. For fourteen years prior to his association with the Indianapolis company he was engaged in organizing and financing utilities. He was interested in street-railway companies in New Jersey, and it was largely through his efforts that the Imperial Electric Light Company of St. Louis, the Scranton Electric Light Company of New Jersey, and the Lackawanna Electric Light Company and the Baltimore Electric Light Company were organized and financed.

George Wilbur Hubley, who for the last two years has been general manager and chief engineer of the Merchants' Heat & Light Company of Indianapolis, has resigned to become general manager of the elevator department of the Badenhause Company of Philadelphia and New York City. His early years in the electrical field were spent with the Westinghouse Electric & Manufacturing Company and also with the Citizens' Traction Company of Pittsburgh, Pa. For twenty years he was chief engineer and superintendent of the old Louisville Lighting Company and its successor, the Louisville Gas & Electric Company, from which he resigned to join the electrical engineering staff of the Jones & Laughlin Steel Company of Pittsburgh.

Major J. O. Mauborgne, who has been in charge of the electrical engineering section of the Signal Corps since March 1918, was born in 1881 in New York City. He was graduated in 1901 from the College of St. Francis Xavier and recommended to the War Department as standing highest in the military department upon graduation. Two years later he was commissioned second lieutenant in the regular army, and he was promoted to first lieutenant in April,

J. O. MAUBORGNE

1909. He was graduated in 1910 from the Army Signal School at Fort Leavenworth, Kan., and for the next three years was instructor there in radio-telegraphy and other branches of engineering and in charge of the electrical laboratory. During 1914 and 1915 he was in charge of the army radio construction work in the Philippine Islands, and from October, 1916, to October, 1917, he was on duty at the Fort Leavenworth Army Signal School, acting as its director from October, 1916, to May, 1917. He was promoted to captain of the Signal Corps in September, 1916, and to major in August, 1917. Since October, 1917, he has been on duty in the office of the chief signal officer of the army. Major Mauborgne has had ten years of experimental work in radio-telegraphy and is the author of "Practical Uses of the Wave Meter in Wireless Telegraphy, 1914," and articles on radio research in the *ELECTRICAL WORLD*, the *London Electrician*, etc. He is also a member of the advisory board of the invention section, War Plans Division, General Staff, U. S. A.

Obituary

Zachary Taylor Underwood, aged seventy-one, an associate of Thomas A. Edison, when the latter was a telegraph operator in Louisville, is dead.

Oran O. Rider, assistant to the general superintendent of the Public Service Company of Northern Illinois, died at his home in Oak Park, Ill., on June 9, following an illness of more than a year. Mr. Rider was forty-seven years old.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

FEDERAL CHILD LABOR STATUTE DECLARED UNCONSTITUTIONAL

Supreme Court of the United States Holds that the
Law Invades the Right of States to
Control Internal Affairs

On June 3 the Supreme Court of the United States handed down a decision holding the so-called child labor law, which went into effect the first of last September, unconstitutional. The court declared that the law unwarrantably invaded the rights of the states to control their own commerce. Friends of the statute, which prohibited the shipment in interstate commerce of the products of child labor, had worked fifteen years for its passage by Congress. Justice Day, who wrote the prevailing opinion, said in part:

"Is it within the authority of Congress in regulating commerce among the states to prohibit the transportation in interstate commerce of manufactured goods the product of a factory in which, within thirty days prior to their removal therefrom, children under the age of fourteen have been employed or permitted to work, or children between the ages of fourteen and sixteen have been employed or permitted to work more than eight hours in any day or more than six days in any week, or after the hour of 7 o'clock p. m. or before the hour of 6 o'clock a. m.?"

"To sustain this statute would not be, in our judgment, a recognition of the lawful exertion of Congressional authority over interstate commerce, but would sanction an invasion by the federal power for the control of a matter purely local in its character and over which no authority has been delegated to Congress in conferring the power to regulate commerce among the states.

"We have neither authority nor disposition to question the motives of Congress in enacting this legislation. The purposes intended must be attained consistently with constitutional limitations and not by an invasion of the powers of the states.

"The far-reaching result of upholding the act cannot be more plainly indicated than by pointing out that if Congress can thus regulate matters intrusted to local authority by prohibition of the movement of commodities in interstate commerce all freedom of commerce will be at an end, and the power of the states over local matters may be eliminated, and thus our system of government be practically destroyed."

Regret over the decision was expressed by the large number of people interested in this class of legislation. A new campaign for a child labor law to meet the Supreme Court's objections, it is understood, will soon be inaugurated in Washington. The law affected jobbers as well as manufacturers.

CONFERENCE TO STANDARDIZE CATALOG SIZES AND PAPER

Meeting in Chicago Adopts Regulatory Resolutions
—Convenience and Economies Are the
Objectives Aimed At

At a catalog conference of the standardization committee of the National Association of Purchasing Agents on May 22, at the Hotel La Salle, Chicago, it was recommended that all catalogs meant for the use of purchasing agents be 7½ in. by 10½ in. in size.

Resolutions were also unanimously adopted to the effect that (1) catalogs be standardized to 6 in. by 9 in., or 7½ in. by 10½ in., or 8 in. by 11 in.; (2) sizes of paper, 25 in. by

38 in., or 32 in. by 44 in., or 33 in. by 46 in., with their double sizes; (3) weights of paper, 40, 45, 50, 60, 70 and 80 lb. on the basis of 25 in. by 38 in. It was recommended that printing colors be limited to white and natural. It is stated that the standardization adopted will release 30,000 people from the printing industry and save much paper.

W. L. Chandler of the Dodge Sales & Engineering Company, Mishawaka, Ind., chairman of the committee, explained the necessity for and advantages of standard catalog sizes. The size previously selected by the association, 8½ in. by 11 in., did not meet with favor.

GOVERNMENT DISCOUNTING LARGE PART OF ITS BILLS

General Engineer Depot Reports All Bills Not Subject to Cash Discount Paid Within Thirty Days
from Date of Service

Since so much of the business of electrical manufacturers and jobbers is with the government at the present time, it is interesting to note the promptness with which payments are made. A report from the finance division of the General Engineer Depot of the army, which purchases vast quantities of electrical goods, states that for the six months ended April 30, 1918, the saving made by the division through cash discounts amounted to \$166,256.03. From May 1 to 15 inclusive cash discounts earned were \$34,144. Many of these discounts were on material the price of which had been fixed by the government. All bills other than those subject to cash discount were paid within thirty days from date of invoice.

DISTRIBUTION OF STEEL PRODUCTS BY WAR BOARD

Agreement Entered Into with the Manufacturers—
Government Virtually Commandeers
the Industry

By an agreement entered into on June 6 between the War Industries Board and the American Iron and Steel Institute the government takes over absolute control of the distribution of all manufactured steel products and pig iron. Under the agreement the War Industries Board must pass upon all applications for the release of steel products and pig iron, thus giving it absolute control of the industry. It amounts to a commandeering of the output of all mills by the government and approaches closely government operation of the industry. A preference list is contained in the announcement and the requirements of the industries named on it must be met before other applications are satisfied.

The committee on steel and steel products of the American Iron and Steel Institute and the War Industries Board have agreed that no pig-iron or steel manufactured products shall be shipped or delivered, except as follows:

"(1) By priority certificates issued by the priorities division of the War Industries Board; or

"(2) After priority certificates shall have been issued or filed, then producers of pig iron and of steel manufactured products may utilize such raw materials and manufacturing capacity, if any, as they may have available to fill orders of their customers not covered by priority certificates, provided that such orders are embraced within the schedule of purposes entitled to preference treatment as determined by the Priorities Board."

No branch of the electrical trade is mentioned in the list promulgated by the board, which is confined strictly to war or collateral and essential activities. However, it is well known that a very large portion of the industry is now engaged in some fashion in war work. In very many instances the war work takes up the major portion of the concern's facilities. Inasmuch as apparently authentic reports state that war work will utilize 100 per cent of the steel output for many months, all steel shipments for some time will have to be made on priority orders. In order to secure these priorities the manufacturer, it seems natural, must have work of a priority nature.

THE WEEK IN TRADE

THE outstanding fact of the week was the recent increase of prices on practically all electrical material. The cause for this action on the part of the producers is variously ascribed, but the main reason is said to be the higher freight rates which become effective June 25. The 25 per cent advances add to the price of material and the costs of manufacturing, to which the shortage of labor and the greater wage scale also contribute. So far the Eastern territory is the first to experience the advances.

Electric fans are running low in supply in the East, where the warm weather has nearly cleaned out stocks, according to authenticated reports. Other parts of the country are not feeling this pressure as yet, and possibly a readjustment of stocks not needed may bring relief in districts not so fortunate. Shipbuilding and other industrial enterprises for the prosecution of the war are being carried on and extended along liberal lines in the Pacific Northwest, with an accompaniment of strong calls for equipment and other electrical material. Heavy motors are being purchased by the larger industrial corporations in the Southeast. In some sections the demand for rubber-covered wire of various grades has increased 100 per cent. The position of conduit is not improved and stocks are scant. The movement of sewing and washing machines is hampered by transportation delays, and on both an increase of price is announced by the manufacturers. As an authority phrases it, the electrical trades are tied up with federal orders and are turning business away. Perhaps this may also have a bearing on the anomalous price situation.

On the whole, collections are stated as constantly becoming better, regular settlements not being deferred. This promptness is due to the enforcement of short credit arrangements, with a tendency toward still further tightening.

NEW YORK

Following the price changes announced last week to a 10 per cent higher level on machinery came an increase, ranging from 10 to 15 per cent, on nearly the entire line of staple materials. Jobbers in this territory were somewhat surprised, but after a study of various trade tendencies regarding labor, material and transportation difficulties and the quick transformation of general mercantile affairs under war pressure it was realized that the market for electrical goods is in a natural state of ferment.

Other industries are going through the same experience. Foresighted distributors who operate on a large scale look for still further advances. They also admit that manufacturers are hampered in their activities, and consequently the obstacles against a free movement of merchandise are growing greater. In fact, reports say that some manufacturers refuse to quote prices and accept orders only on the basis of such prices as may prevail at the time of shipment. Sales have not diminished. On the contrary, the volume of commercial trade has swollen, with government orders continuing to dominate the market. Jobbers are con-

templating the employment of girls as a house sales force to fill the place of men taken for military service.

Collections are better than for some time with the majority of jobbers and distributors. Manufacturers who have heretofore stated that customers were not prompt are now of a different opinion.

FANS.—Predictions regarding the status of electric fans are being realized sooner than expected. The supply in the hands of jobbers is rapidly decreasing, and one of the largest distributors frankly admitted that with one more week of warm weather now it would be impossible to replenish stocks. This concern has been revising its prices for a month past, and on June 8 put out a new fan price list which on some numbers shows an increase of 20 per cent to dealers. It further stated that not a 16-in. fan was in stock and that none were to be had.

DOMESTIC APPLIANCES.—An advance of \$1 apiece on sewing machines was announced by a Western manufacturer, to become effective in the East at once. Distributors are in a quandary whether this should be passed along to the trade and the ultimate consumer or a reduction of profit at the primary source be accepted. At any rate, deliveries are so uncertain as to be hampering all around. This is also true of electric irons from Middle West plants. A Western manufacturer of washing machines has added 15 per cent to the selling price of his products. The demand for vacuum cleaners is brisk and the supply is apparently adequate.

SOCKETS AND RECEPTACLES.—The increase on all porcelain goods ranges from 10 to 15 per cent. It went into effect about two weeks ago. The new prices formulated by jobbers and distributors reflect these quotations. These figures also apply to fuse plugs and all schedule material.

SWITCHES.—An advance of 10 per cent was made within the last few weeks on all standard pendent switches. Stocks are none too strong.

COLLECTIONS AND CREDITS.—While in some quarters collections are reported as slowing down, elsewhere reports say that dealers and jobbers are paying bills promptly. Credit men are not relaxing their vigilance when accommodations or extensions are sought in the settlement of accounts.

CONDULETS.—One manufacturer in sending out a new discount sheet recently tightened the figures quite sharply on certain quantities. He also stated that quotations were f.o.b. factory with no freight allowance.

BATTERIES.—One of the largest manufacturers has made an advance of 10 per cent on his line. Others report all the business they can handle but no recent change in their prices.

HEATING APPLIANCES.—An authority states that it is likely the fall demand for electric heating appliances, radiators, etc., will be quite heavy. Gas companies are already sending out warnings of a probable shortage of gas next winter due to a possible curtailment of fuel. In that event electric fixtures will be called upon to meet the deficiency.

LAMP SHADES.—Flat plain and flat fluted porcelain shades were marked up 10 per cent, effective June 1. Steel-enameled shades were also increased in price at the same rate on that date.

LAMP GUARDS AND BELLS.—Exceptions to the long list of advances on staples recently formulated exist in the case of lamp guards, electric bells and flashlamps.

CONDUIT.—Flexible non-metallic conduit advanced 5 per cent about June 1. Some special brands of conduit were placed on a 10 per cent higher level. Stocks are very low and in certain lines are practically unobtainable.

RUBBER-COVERED WIRE.—As noted last week manufacturers increased rubber-covered-wire prices 2½ to 3 per cent. Some jobbers in their new price lists make it 10 per cent to dealers. This applies to both single-braid and double-braid solid in the standard numbers. On stranded double-braid the cost is higher, reaching 20 per cent in some instances. Discounts range from 60, 5 and 2 to 65, 10 and 5 per cent on bare wire, cable and weatherproof, according to the quantity involved and to the negotiation and credit rating of the buyer.

CHICAGO

The past week might well have been called "conduit week" in Chicago. The market was especially active. This can be attributed to the increase in freight rates and the increase in the price of conduit itself. Motors were also active. The news was given out at the Chamber of Commerce that Chicago is to have a shell plant costing \$6,500,000, and every one is now anxiously watching for an opportunity to supply goods for this project. Building activities in general are still lagging behind. It is encouraging, however, that electrical construction, while also behind last year's figures, is not lagging so markedly as building generally. This is due to the activity of the contractors in securing old-house-wiring business. A threatened strike of electrical workers against the city of Chicago did not materialize. Credit conditions remain especially favorable.

In the freight-rate situation the jobbers see considerable advantage accruing to the jobbing business in general. When the new rates become effective it will be the exception rather than the rule when it is economical for a customer to order direct from the factory.

WASHING MACHINES.—A survey of the washing-machine manufacturing field in the Central West shows that many of the factories are from 2000 to 3000 behind in production of the dolly type. This means that these factories are about one month behind on deliveries. There is said to be no sign of let-up in orders. Many of the orders originate with the government. These factories are increasing their output as rapidly as possible.

COPPER WIRE.—This has been an active week in copper wire. There was no change in price.

PUSH-BUTTONS.—The market on push-buttons is better than it has been in many months. To the equipping of new offices and the installation of time-saving buzzer systems credit is given for this increase.

DIRECT-CURRENT METERS.—Meters of this type are in strong demand, some factories having more than they can take care of.

CONDUIT.—Non-metallic conduit advanced about 10 per cent and metallic conduit between 5 per cent and 10 per cent. The conduit market was especially active, but the jobbers report they are still able to obtain about enough conduit to "get by." The advance in conduit is not at all unexpected, in view of the increased freight rate. In making conduit about five tons of raw material have to be shipped to get one ton of conduit ready to sell. On this basis alone an increase of 12½ per cent would be justified.

FANS.—While fans were active last week, cool weather has slowed up their movement in the immediate vicinity of Chicago this week.

CABLE COMPOUND.—Maintenance work of central stations, which must of necessity be done, is keeping up a steady and satisfactory market on this product.

BOSTON

The volume of trade holds up well, although business is somewhat irregular between different jobbers as to amount. Stocks are well filled in most lines, although slow deliveries are the rule on railroad shipments. Prices are holding firm, with an advance of about 10 per cent on BX conduit and about 20 per cent on non-metallic as of June 6. Retail sales are very good, one large house reporting a greater business over the counter in May than in any other month since last December. Green labor is causing some annoyance in office work as well as in industrial plants, but this condition is likely to improve soon. Edwin C. Lewis, Inc., Boston, has been awarded a contract for the electrical installation to be made at the quartermaster's terminal at Boston. This is said to be the largest electric wiring and supply contract ever placed in New England. It will total between \$1,500,000 and \$2,000,000, including lamps, wire, switchboard panels, hoists, motors and other equipment. Improved labor conditions are noted as regards relations between manufacturers and employees. A basic agreement for future negotiations is reported between the Pittsfield works of the General Elec-

tric Company and the various unions concerned in recent conferences with the federal labor authorities.

APPLIANCES.—Washing machines and vacuum cleaners are moving well. Deliveries are somewhat unsatisfactory, owing to railroad congestion, but the volume of sales is excellent, and so far demands are being met without widespread difficulty.

POLE-LINE MATERIAL.—This material is quiet at present, and one large jobber reports being heavily overstocked. Extensions of central-station service are few and far between, except here and there for war work off the limits of existing lines.

LAMPS.—New England storage supplies suffered a heavy loss by last week's fire in the South Boston warehouse of the General Electric Company, which contained about 1,000,000 lamps, mainly of 25-watt to 60-watt sizes. About 700,000 lamps were ruined, but vigorous efforts are under way to make good the loss. The East Boston and Lynn factories are being pushed to create a new supply, and extensions of the former, combined with available storage facilities, have made it possible already to minimize the disturbance to local distribution. Retailers still report a shortage of miniature and candelabra lamps.

FANS.—Cool weather holds back the expected rush sales. Dealers are well prepared for the summer drive, and jobbers have received large shipments from the factories.

MOTORS.—The demand continues substantial, especially for use on machine tools in army and navy work. Tool manufacturers are finding it difficult to make punctual deliveries, even to the government; but it is not thought that the motor manufacturers are responsible for this condition.

CONDUIT.—Stocks continue to be rather spotty. On the whole, there is not any too much conduit of the larger sizes in sight. Deliveries are running longer than is satisfactory, and the government is looking sharply into the matter of checking priority orders back to their source, with a closer control of actual pipe movement than has previously been noted.

ATLANTA

Activity in all lines is well sustained this week. Staples are moving briskly and the volume continues to grow. The jobbers in this section are taking more interest in activities now going on at coastal and shipbuilding centers.

On the whole, the jobbers were slow in perceiving the big business latent in connection with shipbuilding, but the outlook has changed considerably of late and they have awakened to the potentialities of this type of industry. Already some lucrative sales in marine and associated supplies have been made, and stocks are being replaced, anticipating a growing demand for this material. Deliveries have naturally been good as the greater portion has the benefit of priority shipment.

POLES.—There is a big demand for poles of all descriptions. Jobbers are finding it more difficult each day to handle orders which exceed the supply. In the face of these conditions it is singular that the price has remained the same for some time.

CROSS-ARMS.—The increasing fire requirements of the government have certainly affected the supply of cross-arms, and local jobbers are having a hard time trying to supply a part of the demand.

PINS.—Deliveries are long and only small quantities are available from time to time. Ordinarily prices are stable, but some wide variations have been noted lately in isolated cases where the need was urgent.

HARDWARE.—Call from the central stations has fallen off considerably, and although the government is absorbing large quantities, the volume of transactions at this time is somewhat below that recorded in the past few months.

INSULATORS.—All sources report that the demand appears to be increasing, with a corresponding scarcity. Deliveries are bad and jobbers are endeavoring to satisfy their customers by a distribution of less carload lot shipments.

CONDUIT.—There is no surface evidence of any material change in price, if any, in this line. The arrival of isolated

shipments has tended to balance the stock of all sizes, but the demand is well over replacement and stocks are gradually getting lower. If this condition exists for a protracted period, there is no doubt that Southeastern stocks will be eliminated, at least until such time as government takings are replaced through priority shipments. One jobber predicts a decrease in demand from normal commercial channels while the manufacturers are supplying government needs.

SEATTLE

Wholesale and retail business continues active, although the volume for the week showed no increase over the past week. The sales of large power apparatus have been light for the past ten days, but several orders of considerable size will be placed shortly. Conduit, wire, cable, lamps and small motors to shipyards and allied industries showed a decrease in movement. Retailers report a slight increase in the sales of wiring devices, wire, lamps, fixtures and the like.

Shipbuilding activities—work on the proposed plants, extensions to established institutions and the award of new contracts—still dominate business conditions in the Northwest. The immediate construction of a large wooden shipbuilding plant in South Bend, Wash., is announced. A plant for the construction of concrete barges, lighters, tenders and towboats up to 1500 tons capacity is started in Vancouver, Wash. Additions of considerable proportions have been begun on two Seattle steel plants and a steel and wooden shipyard in Vancouver, Wash. Two industrial plants closely allied to shipbuilding, engaged in boiler and ship machinery manufacture, one in Seattle and the other in Portland, are making large extensions. A Portland plant has secured contracts for six more ships from the Emergency Fleet Corporation.

Reports from various Northwest cities show that building is still on the increase. This is particularly true in Seattle, Tacoma and Puget Sound cities. Portland reports the issue of building permits to be the highest in five years. However, the large portion of the money expended is for new residence construction, although the building of business buildings, hotels and apartments is showing a decided increase. An authority states that the construction of new buildings in Portland at the rate of 4000 per year is necessary to care properly for the increasing population due to new war industries. Seattle builders anticipate a still more serious need of accommodation for war workers and are enlarging and rushing the building program. Astoria, Ore., under the leadership of the port of Astoria, is preparing to erect housing facilities for 5000 families. Contracts for between 400 and 600 residences, three or five large apartments and an enormous hotel for the Puget Sound Navy Yard, Bremerton, Wash., will be let in about ten days by the Seattle office of the Bureau of Housing.

Collections are reported satisfactory and in harmony with sales. New credits placed during May were larger in number than for the preceding month. However, the extension of credit rather than new credit predominates by far.

SAN FRANCISCO

The past week's business is recorded as being unusually good. Orders reported cover generous quantities of all electrical staples and industrial specialties and some stock orders for electrical appliances.

San Francisco building permits for May total \$805,000. An enormous amount of new building was reported during the week. The Santa Fé is greatly enlarging its car shops and terminal facilities at Bakersfield. New rice mills are reported for Woodland and West Sacramento. Important additions to the California Hawaiian plant at Crockett are announced, and educational institutions are represented by a three-million dollar addition to the University of Southern California and by purchases of one, two and three-room portable schoolhouses for various Arizona districts. War-work industrial plants which are adding to their equipment are the Southwestern Shipbuilding Company at San Pedro, ten new building berths for the Bethlehem Shipbuilding Corporation in Alameda and a Stockton tractor plant.

RUBBER-COVERED WIRE.—Sales are continually increasing, and new shipments are gobbled up almost as received. This is especially true of larger sizes, such as 0 and circular-mil sizes, which have increased nearly 100 per cent in their sales over those last year owing to long runs of big energy supplies in the shipyards.

LAMP CORD.—Sales have decreased about 50 per cent in comparison with those of last year, although there are big sales for deck cables, slicked reinforced cords and the like. Sales of lamp cords standardized in fixture use, such as single light 18 or parallel 18, have dropped to practically nothing.

FANS.—Export orders continue. Local shipments on contract orders have been about completed.

LAMPS.—Some big orders for industrial and power plants are reported during the past week.

FUSES.—There have been several large government orders for refillable fuses and extra refills. One cause for the number of standard fuses that are sent to the shipbuilding plants seems to be that work is such that certain fuses blow at very frequent intervals.

HEATING MATERIAL.—The officers' quarters at the Benicia barracks have been equipped with electric ranges and further government work is in sight. The owners and operatives of Camp Curry, in the Yosemite Valley, are enthusiastic over the hotel-type electric range installation, consisting of two 22-kw. ranges, one 25-kw., 180-loaf bake oven, one 9-kw., 18-in. by 54-in. griddle and one 3-kw., sixteen-slice toaster. The rate for electricity for cooking purposes will be 0.8 cent per kilowatt-hour. Energy is to be furnished from the government plant.

METAL MARKET SITUATION

Price of Copper Now Satisfactory and No Further Advance Advocated—Increases on Wire

At a meeting of the leading copper consumers held last week in New York, at which fully fifty firms were represented, the opinion prevailed that the present official price of the metal, 23.50 cents in car lots and over, was fair to all interests. Not only will a sufficient output be forthcoming, but the situation when the price term expires on Aug. 15 will be one to justify no increase in that figure then. One large distributor said deliveries of copper were behind from forty to sixty days, and that it may be longer when the order is finally obtained.

The War Industries Board on June 6 declared that wherever war requirements have created a scarcity of supplies its price-fixing committee would name a price for the commercial consumer that would be reasonable. On the list of these more essential commodities are finished cotton, copper and steel as employed by the electrical trade. Bare copper wire for electrical purposes—carloads, mill shipment—on June 3 was quoted 26½ cents base per pound. The advance is attributed to increased overhead, labor cost and additional costs for affiliated materials.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Master Clock for Standardization of Frequencies

Independent generating stations can be tied together and held at a standard frequency by means of a clock that has been designed and placed upon the market by the Warren Clock Company, Ashland, Mass. This clock is placed on the switchboard in each station within view of the operator. It contains two complete movements, one accurately controlled by a pendulum having an in-bar rod and dead-beat escapement, and the other by a Warren self-starting synchronous motor. There are two second hands on the large upper dial of the clock, which is 5 in. (12.7 cm.) in diameter. One of these hands is black and connects with the pendulum so that it registers the correct time. The other second hand is mounted upon the same center and revolves over the same dial. It is gold color and receives its motion from the Warren motor. The motor, which requires only 2 watts power, is connected to some instrument transformer which is always in the circuit. Therefore the gold circuit hand on the master clock indicates or counts the alternation of the current because it moves at a rate depending entirely upon the frequency of the current.

If the average value of the frequency of the current is exactly normal, the gold handle moves at the same speed as the black hand and they will constantly remain together. If the frequency is above normal, the gold hand will gain on the black hand, and it will lose if the frequency is low. The operator is instructed to adjust the speed of the turbine when these two hands do not agree. It is claimed that this device has an advantage over the ordinary

frequency meter is in use. It has been found in practice on large systems that when the frequencies are controlled by one of these clocks its average value, as measured over a twenty-four-hour period, can be held within one-five-hundredth of 1 per cent of its true values.

This device is especially desirable in the interconnection of power stations now being carried out in order to attain increased economy. It is said to greatly simplify the problem of parallel operation for power stations running at the same frequency.

Motor-Driven Pump for Handling Oil

For pumping oil from a barrel to an overhead reservoir and for oiling systems William W. Nugent & Company, Chicago, have developed and placed upon the market a motor-driven rotary oil pump. It may be used to store oil for use in a gravity oil system. The

PUMP GEARED DIRECTLY TO ELECTRIC MOTOR BY NOISELESS GEAR

pump is driven by a General Electric 1/6-hp. motor by means of gear and a noiseless rawhide pinion. The machine can be fitted with the type of motor required for the prevailing energy supply. The motor is controlled by means of a rheostat and switch box mounted in a convenient location.

Prepayment Watt-Hour Meter

Elimination of uncollectible accounts and reduction in the cost of collecting from the small consumer are achieved by means of a prepayment watt-hour meter that has been developed and placed upon the market by the General Electric Company of Schenectady, N. Y. This meter is called the type I P-5 for use on alternating-current circuits and consists of a mechanically operated prepayment device which is an integral part of the regular I-14 G-E watt-hour meter. As shown in the accompanying

illustration, the prepayment mechanism is actuated by a large coiled spring, wound when depositing the coin. The only load imposed upon the driving element of the meter is that of actuating the tripping device, but this requires practically no energy and therefore

METER AUTOMATICALLY CUTS OUT OF SERVICE WHEN ENERGY PAID FOR IS USED

does not interfere with the accuracy of the meter. The insertion of the first coin and turning of the knob automatically closes the controlling switch. When energy to the value of the deposit has been recorded the switch is automatically opened until another coin has been deposited.

An additional feature claimed by the manufacturers is the fact that the apparatus can be left in service when consumers move in and out of houses. This eliminates the trouble and expense of cutting service, because the equipment is undisturbed.

Light-Weight, Easily Operated Lamp Renewer

Pole climbing or the handling of heavy ladders to make renewals is eliminated by a lamp renewer that has recently been placed upon the market by the G. C. A. Manufacturing Company of 92 Renne Avenue, Pittsfield, Mass. The device consists of a three-jawed clutch mounted upon the end of a pole. The pole is conveniently jointed in sections by means of metal ferrules and quick-change snaps which permit instant adaptation to the length desired. The clutch for the series lamps, which is made to grip the bead on the porcelain of the lamp socket, is opened by pulling a cord and closed by releasing the cord. The series of lamps are re-

TOP PART OF MASTER CLOCK, SHOWING THE TWO SECOND-HANDS

frequency meter because it is not actuated by the temporary fluctuations of frequencies that usually occur in generating stations. The frequency will not be manually changed until it is absolutely necessary. This eliminates, the makers say, the corrections necessary

moved and replaced by pulling or pushing on the bead of the socket.

The lamp renewer for multiple lamps or others that unscrew from fixed sockets is fitted with rubber-tipped projecting fingers which automatically center the glass lamp bulb in the clutch jaws, holding the bulb in the same manner as when unscrewed by hand.

LAMP RENEWERS FOR BOTH SERIES AND MULTIPLE UNITS

These devices are made in four models—one for series street lamps 100 cp. and smaller, one for series street lamps 250 cp. and smaller, one for series street lamps 1000 cp. and smaller, and one for multiple lamps which accommodates all sizes. Each model includes 7 ft. (2.1 m.) of pole, besides the clutch mechanism. Additional 42-in. (104-cm.) interlocking pole sections may be obtained if desired.

Power-Driven Machine for Boring Pole Holes

Pole holes for transmission and distribution lines can be quickly and efficiently bored by means of a machine that has been placed upon the market by the International Earth-Boring Machine Company, P. O. Box 408, Chicago. The machine shown in the accompanying illustration is mounted upon a steel roller-bearing hub truck and consists of a turntable 5 ft. by 12 ft. (1.5 m. by 3.7 m.) upon which is arranged the mechanism for transmitting the power from the driving engine to the boring auger. The turning power and pressure is applied by means of gears on the tower. The equipment is so balanced upon the turntable that it may be swung around to any point of boring and also may be adjusted for boring on hills or inclines at an angle of from 15 deg. to 20 deg. The motive power for the device shown in the illustration consists of a 40-hp. motor. Its connection with the gearing of the boring equipment is by means of a heavy socket chain. Two levers are provided for operating the auger, one controlling the speed and the other raising and lowering the auger. When boring in the ground the speed is about 10 ft. (3 m.) per minute, and when raising the pole from the hole, 25 ft. to 50 ft. (7.6 m. to 15.2 m.).

Two men can operate this machine, and it is claimed that the efficiency is,

on the average, 100 poles in a ten-hour day. This includes digging the hole, setting the pole and moving from one point to another. Provision is also made for equipping the earth-boring machine with a derrick for raising poles from the ground and lowering them into the holes. Augers of various sizes from 3 in. to 30 in. (7.6 cm. to 76 cm.) may be used with satisfactory results. The holes bored by this equipment are uniform and clean-cut, and the soil removed from the holes is well broken up for tamping purposes. In addition to the use of the machine for pole-line construction work, it may be advantageously utilized in digging trenches for underground conduit. For this purpose a series of holes, close together, may be bored and then the intervening walls removed, thus forming the trench.

A third model is being designed by the company that will be adaptable and attachable to any power truck with a

HOLES CAN BE QUICKLY AND EFFICIENTLY BORED WITH THIS MACHINE

shaft drive. It will then be able to be detached when earth-boring apparatus is not being used and the truck used for other purposes. This machine can well be used in city work such as putting pole holes in alleys and narrow streets.

Concrete Mixer for Manhole and Conduit Work

For mixing concrete for work on manholes and conduits the Oshkosh (Wis.) Manufacturing Company has placed upon the market a mixer that is said to be efficient and economical on construction of this kind. This type of work becomes very expensive when done by hand, and its heavy nature makes it hard to get men to do it. The mixer, as the manufacturers claim, is particularly fitted for manhole and conduit work and is highly portable, weighing only 1600 lb. (726 kg.). It is also said that it will withstand the hard

wear that it would be sure to get in this kind of service.

This mixer, known as the "Eveready," has a batch capacity of 4 cu. ft. (0.11 cu. m.) and turns out a perfect mix in forty-five seconds, which gives it a rating of 35 cu. yd. to 50 cu. yd. (26.7 cu. m. to 38.2 cu. m.) per day. The machine is of the worm-type drive, the worm gear running in oil and being completely housed, together with the bearings and shaft. The mixing drum is of the tub type and has the "four motion" mix. Material is shoveled in at an opening of ample size, and the drum is automatically discharged by opening a shutter and allowing the mixed batch to run out either into a wheelbarrow for conveyance or direct into the forms.

The whole drum can be discharged in twelve seconds, or only a portion of it may be discharged at a time, a feature which is very desirable in a mixer of this kind. The "Eveready" is driven by a 2-hp. two-cycle horizontal water-cooled gasoline engine directly connected.

Lighting Fixture That Fits Any Standard Socket

Objectionable glare is eliminated in a lighting fixture called the "Amco-Illuminet," according to the manufacturer, the Art Metal Manufacturing Company, Cleveland, Ohio. The fixture is a combination of metal and glass, the metal part being spun over the glass, forming one piece. The neck of the metal part of the fixture is so made that when it is pushed up over the head of the standard socket it snaps into place and forms one continuous line with the socket, as shown in the accompanying illustration. The glass is made with the bottom open, the bottom being made of various sizes to fit the large part of the standard 75, 100 and 150-watt type C lamps. The lamps used in the fixture have their bottom portion frosted, the bottom of the lamp

COMBINATION METAL AND GLASS FIXTURE

thus forming the lower part of the fixture. A flat, polished metal reflector is placed on the inside of the upper portion of the fixture and acts as a projector and diffuser to intensify the light downward and outward over a wide area.

Trade Notes

R. A. COVELL, who for some time has been connected with the New Haven office of the Cutler-Hammer Manufacturing Company of Milwaukee, Wis., has become office manager of the New York branch of the company.

THE GENERAL ELECTRICAL COMPANY of Chicago has lately opened a large branch with offices and a traveling force in Memphis, Tenn., in the Lotus Building, Jefferson Avenue, near Second Street, where the entire first floor is occupied.

ALBERT S. LINDSTROM has resigned as general manager of the Thordarson Electric Manufacturing Company of Chicago and has accepted a position at Washington, D. C., as representative for the Moloney Electric Company of St. Louis, Mo.

C. R. HUGHES, who was formerly sales manager of the Mineralac Electric Company of Chicago, has been made manager to succeed James Van Buskirk, who resigned to assume the management of the Chicago office of the Moloney Electric Company of St. Louis.

CHARLES A. McCUNE has resigned his position as chief engineer of the Commercial Acetylene Company to become sales engineer with the Page Steel & Wire Company, 30 Church Street, New York, where his efforts will be devoted to service in connection with Armo welding rods.

THE DOEHLER DIE CASTING COMPANY of Toledo, Ohio, which is housed in a model factory building completed a little more than a year ago, has in this short space outgrown its quarters. In order to provide for this expansion the company has found it necessary to take over the adjoining plant of the Ohio Electric Company, doubling the present capacity.

THE APPLIANCE MANUFACTURING & DISTRIBUTING COMPANY has leased the building formerly occupied by the Rutenber Electric Company and will establish a plant for manufacturing heating appliances and other specialties at Logansport, Ind. The company was formerly established in Chicago. It will also hold the State agency for the Brascolite lighting fixtures.

J. L. FUGATE of Salt Lake City, Utah, has associated himself with the William A. Mullins Electric Company of Tacoma, Wash., occupying the position of sales and factory manager. Mr. Fugate was manager of the factory and fixture department of the Capitol Electric Company of Utah. This concern has twenty-one stores in Idaho, Utah and Montana, which were under his supervision.

R. L. LUNT, electrical engineer of Minneapolis, Minn., has become connected with the sales department of the Packard Electric Company, in charge of the Minneapolis branch, 716-18 McKnight Building. For years Mr. Lunt was connected as sales engineer with the Western Electric Company's Philadelphia office. From there he went with the Electric Storage Battery Company of Philadelphia.

THE PARR TERMINAL COMPANY, Wilfred N. Ball engineer, 225 First National Bank, Oakland, Cal., wants catalogs and other data from manufacturers of electrical materials or equipments used in the construction of piers, warehouses, industrial buildings, belt line railway and street work and cargo-handling equipment, coal bunkering and handling equipment, floating drydock and marine railway equipment, and general shipyard machinery and equipment.

WIRELESS CASE POSTPONED.—The case of the Marconi Wireless Telegraph Company of America vs. the Kilbourne & Clark Manufacturing Company of Seattle, Wash., has been postponed for the duration of the war at the request of the United States Navy Department, formally made in letters addressed to both parties to the controversy. As the case stands now apparatus is being manufactured by Kilbourne & Clark under the protection of a decision of the United States District Court, which held that the company is not infringing. The case had been brought before the United States Circuit Court on the appeal of the Marconi Company.

THE FEDERAL TRADE COMMISSION of Washington, D. C., has ordered the establishment of three branch offices of the commission in New York City, Chicago and San Francisco. The following members of the staff of the commission are to be in charge of the newly established offices: A. P. Thom, Jr., Custom House, New York; Walter B. Wooden, 14 East Jackson Boulevard, Chicago; D. N. Dougherty, Appraiser's

Stores Building, San Francisco. The work of the commission has grown enormously as it touches war problems in the finding of costs of production and in the determination of stocks of war and contributing materials on hand and the production capacity for such materials. A great deal centers in New York and Chicago and a constantly increasing amount of work is coming to the commission from the Pacific Coast.

Trade Publications

FARM LIGHTING PLANTS.—The Winters Farm Light Company, Davenport, Iowa, has issued a booklet describing and illustrating its farm lighting plants.

ADDING MACHINES.—The Teetor Adding Machine Company, Des Moines, Iowa, has issued a circular describing and illustrating its electrically driven adding and subtracting machine.

FARM LIGHTING SYSTEM.—The Marron Manufacturing Company, Rock Island, Ill., is distributing a circular describing the Marron farm lighting system and telling why this type of unit should be used.

SWITCHES.—"Snap Switches That Are Different" is the title of folder No. 251, which is being distributed by the Cutler-Hammer Manufacturing Company of Milwaukee, Wis. This folder illustrates and describes the features of the C-II snap switches.

LABOR-SAVING DEVICES.—The Hurley Machine Company of Chicago has just issued its 1918 catalog of Thor electric labor-saving devices for the home. The catalog illustrates washing machines, ironing machines and vacuum cleaners. It contains forty-eight pages.

RESISTANT UNITS.—An automobile storage-battery charging unit for use in connection with the Delco-Light 32-volt plant is described and illustrated in a circular that is being distributed by the Ward Leonard Electric Company of Mount Vernon, N. Y. The connections of the lighting outfit are shown.

POLYPHASE MOTORS.—Polyphase motors are illustrated and described in a bulletin, No. 25, that has been issued by the Century Electric Company of St. Louis, Mo. Motors of ½ hp. to 60 hp. of the automatic-start induction type are discussed. Several applications of this type of motor are illustrated.

AUTOMOBILE SUPPLIES.—Automobile supplies and garage equipment are described in catalog 122, issued by the Julius Andrae & Sons Company, Milwaukee, Wis. This book contains 515 pages and contains practically everything in accessories for the automobile. Net price list and discounts applying to this catalog are distributed with it.

ELECTRICAL DIRECTORY OF MILWAUKEE.—The Milwaukee Jovian League has compiled and published an electrical directory containing the names of the local members of this organization with their company connection and a complete directory of all electrical manufacturers, dealers, contractors, engineering firms and other concerns handling or making electrical goods and machinery.

BOILER-FEED PUMPS.—Centrifugal boiler-feed pumps are described in a pamphlet issued by the De Laval Steel Turbine Company of Trenton, N. J. The pumps are shown with casing removed, showing the turbine rotors and pump impellers. Cross-sectional views are also produced. Actual installations of De Laval motor-driven boiler-feed pumps in large central power stations are also illustrated.

LAMP SHADES.—Bowls and shades with "Rozelle" color decorations applied to Volvra and Ivre glass are illustrated in actual colors in catalog No. 260, issued by the Ivanhoe-Regent Works of the General Electric Company, Cleveland, Ohio. Decorative lighting for the home is discussed, and explanations of the different names of colored decorations are given. This company is also distributing a price list for catalog No. 257.

WIRE.—"Aristos Copper-Weld, Copper-Clad Wire" is the title of a 104-page book that has just been issued by the Page Steel & Wire Company, 30 Church Street, New York. This book contains notes on the manufacture of wire in general and on physical and electrical properties of composites (copper-weld wire); gives tests, specifications and suggestions for determining size of wire for high-tension, telephone, telegraph, signal, police and fire alarm lines; contains helpful information for cal-

culating line drops, meters and short transmission lines, sag and tension in spans, etc. Individual chapters also deal with different sizes of plain copper-weld wire, copper-weld weatherproof wire, tie wires, rods and other copper-weld products. A copy of this bulletin will be mailed on application to the company.

LIGHTING UNITS.—"Scientific Industrial Illumination" is the title of booklet No. 163 that is being distributed by the Holophane Glass Company, 340 Madison Avenue, New York City. This very complete booklet deals with the need of scientific illumination and gives photographs showing how Holophane scientific illumination decreases spoilage in machine shops and other plants. It also discusses fatal accidents due to insufficient illumination. Reflectors are discussed, and distribution curves of the various types are illustrated. Outdoor and indoor illumination of large areas and protective yard lighting are explained in full, with illustrations showing the typical curve for the refractors. Illumination data on such points as the intensity of illumination required in different working spaces are given, as are lamp data and metric and legal equivalents.

New Incorporations

THE CHATTANOOGA (TENN.) PLUMBING & ELECTRICAL COMPANY has been incorporated with a capital stock of \$24,000 by V. B. Whiteside, W. C. Teas, P. W. Curtis and others.

THE WINTER STORAGE BATTERY COMPANY of Middletown, N. Y., has been incorporated with a capital stock of \$54,000 by M. E. Slawson, E. E. Kidney and E. A. Wheeler of Middletown.

THE BEARMAN-HUGENOT ELECTRIC COMPANY of Mobile, Ala., has been incorporated by R. Baerman, H. Baerman and E. T. Huguenot. The company is capitalized at \$15,000 and proposes to do an electrical contracting business.

THE CITIZENS' CONSOLIDATED POWER & ELECTRIC COMPANY of Poteau, Okla., has been incorporated by Wiley W. Lowrey, H. J. Fowler and E. S. Hutton. The company proposes to construct and operate an electric plant in Poteau.

THE BOLTON-WECHTEL COMPANY of Brooklyn, N. Y., has been chartered with a capital stock of \$20,000 to deal in batteries and auto accessories. The incorporators are: H. J. Wechtel and W. C. Bolton, 261 Stuyvesant Avenue, Brooklyn.

THE EDISON PRIMARIES BATTERIES COMPANY of West Orange, N. J., has been incorporated with a capital stock of \$500,000 by Thomas A. Edison, Charles Edison and Stephen E. Mainbert. The company is a subsidiary of the Thomas A. Edison Company.

THE NATIONAL FIRE & BURGLARY PREVENTION COMPANY of Dover, Del., has been chartered with a capital stock of \$150,000 to manufacture fire and burglar alarm systems, etc. The incorporators are: M. M. Clancy and F. A. Armstrong of Wilmington, Del.

THE HOME ELECTRIC EQUIPMENT COMPANY of Clarksburg, Va., has been organized to deal in electrical products. The officers are A. Hattenbach, president; W. S. Waters, vice-president, both of Pittsburgh, Pa., and H. T. Gates, secretary and manager.

BOYLE & ESSENWANGER, INC., of Buffalo, N. Y., has been incorporated with a capital stock of \$10,000 by Harry J. Boyle, Louise M. Boyle and George P. Essenwanger of Buffalo. The company proposes to manufacture all kinds of electric storage batteries.

THE MARS MANUFACTURING COMPANY of New York, N. Y., has been incorporated by Max Ebetz, Solomon Luber and Edna I. Lines of New York City. The company is capitalized at \$10,000 and proposes to manufacture all kinds of electric and electro-technical novelties.

THE MARSHALL ELECTRIC COMPANY of Marshalltown, Iowa, has been chartered with a capital stock of \$50,000 to deal in electrical supplies of all kinds. The officers are: E. N. Peak, president; A. J. Clark, vice-president; R. W. Van Horn, treasurer, all of Marshalltown.

THE WATERLOO STORAGE BATTERY COMPANY has been incorporated with a capital stock of \$25,000 to deal in electric storage batteries, automobile accessories, supplies, etc. The officers are: E. G. Mann, president and general manager; Clifford DeFuy, treasurer, and Earl S. Linn, secretary.

New England States

HILL, N. H.—The local electric-light plant, owned by Frank R. Woodward, was wrecked by a flood caused by the breaking away of a dam. The plants of the New England Novelty Company and the George H. Adam Needle Company were also badly damaged. The total loss is estimated at about \$50,000. The town is at present without electrical service.

AMHERST, MASS.—Plans are being prepared for the construction of a new turbine house at Massachusetts Agricultural College in connection with the installation of a new coal-handling plant. The cost of the proposed work is estimated at about \$55,200. James H. Ritchie, 8 Beacon Street, Boston, is architect.

BOSTON, MASS.—James J. Storrow, New England Fuel Administrator, has appealed to the National Fuel Administration for authority to restrict the use of electricity for signs and other forms of display lighting in order to reduce the consumption of coal.

BOSTON, MASS.—The Eastern Massachusetts Electric Company has filed a petition with the Board of Gas and Electric Light Commissioners asking permission to issue \$300,000 in bonds and \$83,200 in capital stock. The company states that it requires additional funds to meet the indebtedness incurred in the construction of transmission lines and extensions to its property in Salem and Malden.

LEOMINSTER, MASS.—The Leominster Electric Light & Power Company has applied to the Council for permission to erect and maintain high-tension transmission lines through Nashua, Hamilton and Nile Streets for the purpose of supplying electricity to the new factories of the Standard Comb Company.

PEABODY, MASS.—Plans have been prepared by A. E. Bump, 60 North Market Street, Boston, architect, for a one-story addition to the power plant of the A. C. Lawrence Leather Company, Crownshield Street.

QUINCY, MASS.—Lieut. George Summersby, U. S. N., has petitioned the Board of Gas and Electric Light Commissioners to authorize the Murray & Tregurtha Company of Quincy to obtain electricity from the Edison Electric Illuminating Company of Boston to operate two aircraft plants. The law stipulates that whenever possible power must be purchased from the local company.

SPRINGFIELD, MASS.—The Little River power bill, which permits the city of Springfield to generate power from its Little River water system has been signed by the Governor. The Water Department will begin immediately preparing plans for power development to utilize water now going to waste for power development.

WORCESTER, MASS.—The Worcester Electric Light Company has purchased land (about 15,000 square feet) adjoining its present property. The site, it is understood, will be used as an extension of the Webster Street plant.

WORCESTER, MASS.—The New England Power Company has petitioned the Board of Gas and Electric Light Commissioners for permission to issue \$350,000 in capital stock and \$600,000 in bonds, the proceeds to be used to meet obligations incurred in the erection of power and transmission lines and improvements to its plants at Webster and Milford.

Middle Atlantic States

BROOKLYN, N. Y.—Contract has been awarded by Rubel Brothers, Inc., Glenmore Avenue, to the George Weideman Electric Company, 191 Flatbush Avenue, for all electrical work in connection with the construction of a large ice manufacturing plant at Blake and Van Sinderen Avenues.

BROOKLYN, N. Y.—The contract for the electrical work and equipment in connection with the reconstruction of the large public bath house at Sea Breeze Avenue, near Ocean Park, has been awarded to Louis Kalisher, 1225 Myrtle Avenue. The cost of the building is estimated at about \$275,000.

BROOKLYN, N. Y.—The Robert Gair Company, 50 Washington Street, has awarded contract for the construction of a four-story extension to its boiler plant, at Plymouth and Washington Streets, to the Turner Construction Company, 244 Madison Avenue, New York City. The cost of the proposed improvement is estimated at about \$20,000.

DUNKIRK, N. Y.—The Common Council has accepted the report of the special committee recommending the installation of a

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

single-lamp standard system for the new ornamental lighting system on the business streets. Bids will soon be asked by the street committee of the Council for the equipment and installation of the proposed system.

FAIRPORT, N. Y.—Arrangements are being made by the Rochester Railway & Light Company to extend its electric transmission line to Fairport to supply electricity to the Sanitary Car Company.

HUDSON, N. Y.—Plans are being considered by Benjamin Wenzel, who conducts the Lake Charlotte House, to establish an electric-light plant to supply electricity for lighting the hotel, cottages and farmhouses in that vicinity. It is proposed to utilize the fall of water from the lake to generate the power.

NEW YORK, N. Y.—The Detroit Cadillac Motor Car Company, 1881 Broadway, is planning to install a service and repair works in connection with its new 12-story building to be erected at Columbus Avenue and Sixty-second Street, New York, at a cost of about \$600,000. Frederick T. Ley & Company, 19 West Forty-fourth Street, have the contract for construction of building.

SYRACUSE, N. Y.—Plans are under consideration by the City Council for the construction of a new electrically-operated pumping plant at the municipal sewage disposal works, to cost about \$8,000.

UTICA, N. Y.—Improvements are under way at the local plant of the Adirondack Electric Power Corporation and will soon be completed. The work will include the installation of a new boiler, generators and transformers.

CAMDEN, N. J.—Bids are being asked by the New York Shipbuilding Company of Camden for the erection of a one-story plate and angle shop, 200 ft. by 594 ft. Plans are also being prepared for a new steel fabricating plant and for a one-story forge shop 45 ft. by 55 ft. The company has awarded contract to Doyle & Company, 1519 Sansom Street, Philadelphia, Pa., for the construction of an office building at the works, to cost about \$75,000.

JERSEY CITY, N. J.—The Terminal Transit Company, it is reported, is planning to construct a shipbuilding plant at Doyer's Point, Newark Bay, Jersey City.

KEARNEY, N. J.—Contract has been awarded by the Ford Motor Car Company, Highland Park, Detroit, Mich., for electrical work in connection with the new factory building, located at the site of its proposed new shipbuilding plant on Newark Bay, to the K. W. Electric Company, 49 Lawrence Street.

NEWARK, N. J.—Plans have been prepared by the Public Service Company for the erection of a new building, 50 ft. by 162 ft., at Bloomfield Avenue and Lake Street.

NEWARK, N. J.—Alfred Sommer, 466 Summer Avenue, submitted the lowest bid (\$9,379) to the Board of Education for electrical work in connection with the proposed improvements to the Hawkins Street school building.

NEWARK, N. J.—The plant of the Gleason Wire Company, John Street, East Newark, was damaged by fire recently, causing a loss of about \$65,000. It is understood that the works will be rebuilt at once. The company manufactures electric wires, etc.

PLAINFIELD, N. J.—Four additions are being erected to the plant of the Niles-Bement Company on South Second Street. Two of the large buildings will be 100 ft. by 180 ft., one story high. A large boiler plant is also being built in connection with the improvements. The cost of the work is estimated at about \$400,000.

EASTON, PA.—Preparations are being made for the installation of a 10,000-kw. turbine at the Dock Street station of the Pennsylvania Utilities Company. A condenser will also be installed at the same time. It is expected to have the new equipment in operation by August 1.

ERIE, PA.—Work is progressing rapidly on the installation of the ornamental street-lighting system along State Street and in Perry Square.

GLENWOOD, PA.—Contract has been awarded by the Baltimore & Ohio Railroad Company to the Westinghouse-Church-Kerr Company, 37 Wall Street, New York, N. Y.,

for the erection of locomotive repair shops at Glenwood, to cost about \$1,700,000.

HARRISBURG, PA.—Plans are under consideration by the Harrisburg Light & Power Company for placing its overhead wires in underground conduits.

HARRISBURG, PA.—The City Council is considering plans for extensions to the police and fire-alarm systems, for which plans have been prepared. Clark E. Diehl is city electrician.

PHILADELPHIA, PA.—Improvements are being considered for the power plant of the Miller Chemical Company at Delaware Avenue and Milfin Street.

PHILADELPHIA, PA.—The new foundry addition to be erected by the Aetna Foundry Company, Twenty-second Street and Allegheny Avenue, will be equipped with a 10-ton electric traveling crane.

SHARON, PA.—Plans are under consideration by the Savage Arms Company, 50 Church Street, New York, N. Y., for the construction of an addition, 40 ft. by 60 ft., to the power plant at its local works. Griggs & Myers, 110 West Fortieth Street, New York City, are engineers.

WAYNESBORO, PA.—The Chambersburg, Greencastle & Waynesboro Street Railway Company has begun work on the erection of a large steel tower to be located near its new building in East Main Street. The tower will receive high-tension current from the power house at Security, Md.

TIMONIUM, MD.—Plans are being considered by the Maryland State Fair and Agricultural Society for the installation of electric lamps on the grounds, erection of dancing pavilion and several new exhibition buildings. Louis McLane Merryman of Cockeysville is president.

HUNTINGTON, W. VA.—The Consolidated Light, Heat & Power Company, it is said, will petition the United States government for assistance in enlarging its plant to provide for the extraordinary demands upon it by war industries in this district, including Huntington and Ashland. Four new boilers are needed for the plant, which cannot be purchased as the government has commandeered all of that product. The assistance will be in nature of a loan. The government will furnish the needed equipment, to be used exclusively for war work. W. R. Power is general manager.

KINGWOOD, W. VA.—The Hoffman Coal Mining Company, recently incorporated with a capital stock of \$30,000, is planning to install an electric power plant to supply energy to operate machinery in the mines.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 17 under specification 3046 for two hydro-pneumatic gate elevators for dry docks at Philadelphia, Pa., and Norfolk, Va. The cost is estimated at \$15,000.

WASHINGTON, D. C.—Extensions are being made by the Potomac Electric Company to provide service for the many additional government buildings in Washington and to the camps and cantonments established around the city. A 15,000-kw. generating unit was installed in January, 1917, and orders have been placed for another unit of the same capacity, which is promised for delivery July 5, 1918. The company is now negotiating for a third generator of the same size. Boiler equipment for this additional power is also being installed. Additional substation equipment has been purchased, and the company is negotiating with the government to supply steam heat for certain new buildings of the government if erected near the station.

North Central States

GRAND RAPIDS, MICH.—Plans are being prepared by the Wernette-Bradfield Mead Company for remodeling the power plant of the Holland Furniture Company.

HOUGHTON, MICH.—The Peninsular Power Company of Houghton is building a power plant on the Brule River. The plans provide for a development of 5000 hp.

LIMA, OHIO.—An election will probably be called in August to submit a proposal to issue bonds for the installation of a municipal street-lighting system, instead of renewing the existing contract.

MIDDLETOWN, OHIO.—The County Commissioners have awarded the contract for lighting the viaduct between Middletown and West Middletown to the Beattie Electric Company of Cincinnati, at \$2,113.

DEERING, KY.—The Deering Telephone Company, recently incorporated, is contemplating the installation of a 25-mile telephone system. A. B. Johnson is president.

LOUISVILLE, KY.—A new garage, to cost about \$5,000, is being erected by the Columbia Truck Company, 119 South Seventh Street, Louisville. Equipment, including a drill press, overhead crane and general shop equipment, will be required.

ATTICA, IND.—Plans are being prepared for the construction of a new electric-light plant and water-works system for the Attica Electric & Power Company, to cost about \$100,000. Rubel & Wells, Chemical Bank Building, St. Louis, Mo., are engineers. R. H. Freeland is superintendent.

CONNERSVILLE, IND.—Plans are being considered by the Indiana Lamp Company for the construction of an addition to its plant, to cost about \$50,000. E. M. Ansted is manager.

GARY, IND.—The Gary Street Railway Company is contemplating an extension on East Fifth Avenue to the Aetna gunecotton plant, 2 miles east of Broadway.

MADISON, IND.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until July 5 for conduit and wiring, gas piping and lighting fixtures in the United States post office at Madison. For details see Searchlight Section.

CHICAGO, ILL.—Contracts have been awarded by the Commonwealth Edison Company, 223 East Grand Avenue, for the erection of an addition to its power plant, to cost about \$8,000.

CHICAGO, ILL.—The former plant of the Allis-Chalmers Company at Washtenaw Avenue and Twelfth Street has been purchased by David A. Wright, 568 Washington Boulevard, Chicago, manufacturer of machine tools, which is being equipped with machinery for manufacturing Fifield lathes, special double-end gun boring and turning lathes, etc. The main building is 140 ft. by 500 ft., and is equipped with a traveling crane. Electricity will be used as motive power.

JACKSONVILLE, ILL.—Plans are being considered by the Board of Education for the construction of a new high school building, including boiler house, metal shop and smokestack, to replace building destroyed by fire several weeks ago. The cost is estimated at \$175,000.

BRODHEAD, WIS.—Preparations are being made for remodeling the municipal electric light plant, at a cost of about \$35,000. The Power Engineering Company, Corn Exchange Building, Minneapolis, Minn., has charge of the engineering work.

CHIPPewa FALLS, WIS.—The old lighting plant of the Wisconsin-Minnesota Light & Power Company was recently put out of commission when the flume leading from the canal to the wheels of the plant gave way. The lighting plant will now be permanently abandoned.

CLINTONVILLE, WIS.—A syndicate of local business men has acquired practically the entire water-power rights on the Little Wolf River at Little Wolf, Phillips, Osterander and Royalton, Wis. Tentative plans are being prepared to construct dams and hydroelectric power plants to develop about 2500 hp. The initial work may begin this year. W. A. Olen, president of the Four Wheel Drive Automobile Company of Clintonville, is interested in the project.

CUDAHY, WIS.—Contract has been awarded by the Ladish Drop Forge Company, Park Avenue, to Klug & Smith, consulting engineers, Mack Block, Milwaukee, to prepare plans and construct an addition 50 ft. by 60 ft. to its boiler house.

MONROE, WIS.—Contract has been awarded by the Marty-Gempeler Company to Wagner & Bauman of Monroe for construction of cheese factory, warehouse and power house, to cost about \$18,000. Claude & Starck of Madison are architects.

NEW LONDON, WIS.—A contract for addition to the municipal power house has been awarded to V. Thomas of New London.

NIAGARA, WIS.—The Trustees of the village of Niagara have granted the Niagara Light & Power Company a franchise to supply electricity in Niagara, subject to the approval of the Public Utility Commission.

WAUSAU, WIS.—Plans for the installation of a central heating and lighting plant in Wausau are reported to be under consideration by the merchants of Wausau.

WEST ALLIS, WIS.—Ground has been broken for the foundry unit of the new manufacturing group of the Universal Machinery Company, 784 Thirtieth Street, Milwaukee. Contracts will soon be awarded for the machine shop unit, which will be 150 ft. by 480 ft. Frank E. Gray and Val A. Siebert, associated architects, 86 Michigan Street, Milwaukee, are preparing plans. E. L. Devlin is president.

WEST BEND, WIS.—A two-story addition, 25 ft. by 40 ft., is being erected at

the plant of the West Bend Heating & Lighting Company. New equipment, including automatic stoking and coal and ash-handling equipment will be installed.

DULUTH, MINN.—Plans are being prepared by the Duluth Street Railway Company to extend its railway from South Superior to Oliver.

PINE CITY, MINN.—The Eastern Minnesota Power Company of Pine City has extended its electric transmission line through Rodum.

APPLETON CITY, MO.—Contract has been awarded by the Missouri, Kansas & Texas Railway Company to the Queen City Electric Company of Sedalia for electric wiring in connection with the erection of a number of buildings, etc., at Appleton.

INDEPENDENCE, MO.—Arrangements are being made by local business men for the location of an electric railway from Independence to Sugar Creek, a small industrial center, about 1½ miles from this city. The cost of the proposed railway is estimated at about \$50,000, of which about \$13,000 has been subscribed. The Kansas City (Mo.) Railways Company will construct and operate the line. Preliminary surveys have been made.

KANSAS CITY, MO.—Contract has been awarded by the Kansas City Railways Company for the erection of substation No. 2 to L. Breitag & Son Construction Company, 3701 West Prospect Place, Kansas City. The building will be 43 ft. by 82 ft., and will cost about \$25,000.

KIRKWOOD, MO.—The sale of the municipal electric generating plant to the Union Electric Light & Power Company of Webster Groves is reported to be under consideration by the Board of Aldermen. It is not proposed to sell the distributing system, but to purchase energy from the Union company, for local distribution.

ST. JOSEPH, MO.—The St. Joseph Warehouse Cold Storage Company is reported to be contemplating the installation of new ice-manufacturing machinery, etc., to cost about \$50,000. H. R. Worsley is architect and engineer.

BANCROFT, NEB.—Material for power house and equipment for the new municipal electric light plant have been received. The cost of the proposed system is estimated at about \$45,000.

BELVIDERE, NEB.—Lighting bonds to the amount of \$7,000 for the town of Belvidere have been approved by the State auditor.

FALLS CITY, NEB.—Bonds to the amount of \$60,000 for improvements to the municipal electric-light plant in Falls City have been approved by the State auditor.

SYRACUSE, NEB.—Preparations are being made for the installation of new equipment in the municipal electric light plant, for which bids have been received. The cost is estimated at \$7,500.

THURSTON, NEB.—The installation of an electric lighting system in Thurston is under consideration.

KANSAS CITY, KAN.—The Contractors' Machinery Company of Kansas City, Kan., is contemplating the purchase of two 500-hp. water-tube boilers and other equipment.

Southern States

HIWASSEE, N. C.—A decision handed down by the court permits the Carolina-Tennessee Power Company to construct a hydroelectric power plant on the Hiwassee River in Cherokee County near the Tennessee State boundary. The properties include land and water rights for a distance of 26 miles. The project includes the construction of two dams, each 150 ft. high, one near Tennessee and the other 13 miles up the river, to develop about 60,000 hp. W. V. M. Powelson, care of Bertram, Grison & Company, 421 Chestnut Street, Philadelphia, Pa., is engineer.

SPRAY, N. C.—Plans and specifications are being prepared for the erection of two large mill buildings, one a one-story weave shop, 1300 ft. by 250 ft., and the other a four-story spinning mill, 1300 ft. by 150 ft., by the Carolina Cotton & Woolen Mills Company at Fieldale. The initial unit will provide for 75,000 spindles and will cost about \$2,000,000. The ultimate plan is for a total of 300,000 spindles and accompanying looms. The general land developments for the village are progressing and many buildings for dwellings, offices, etc., are in course of construction. The Carolina Cotton & Woolen Mills Company is controlled by Marshall Field & Company of Chicago, Ill.

FLORENCE, S. C.—The Florence Ice & Fuel Company, recently organized, is reported to have purchased the ice plant of the Carolina Gas & Electric Company.

FLOVILLA, GA.—An election will probably be called soon to submit to the voters the proposal to issue \$25,000 or \$30,000 in bonds for the installation of an electric-light plant and water-works system.

WAUCHULA, FLA.—The Wauchula Light & Power Company is contemplating the installation of a fertilizing mixing plant of 5 tons capacity, and also a crate mill with a daily capacity of 2000 packages.

CHATTANOOGA, TENN.—The F. J. Lewis Manufacturing Company has purchased a site (five acres) adjoining the oven plant of the Chattanooga Coke Company, on which it proposes to erect a coal tar distilling plant, 200 ft. by 64 ft., to cost about \$40,000. The plans provide for a power plant, several stills, steel tanks, etc. Contract for buildings has been awarded to the Mark Wilson Company of Chattanooga. W. H. Lewis, 2500 South Robey Street, Chicago, Ill., is vice-president.

JONESBORO, TENN.—Plans have been prepared by the Pleasant Valley Telephone Company for the construction of a new metallic telephone system to Johnson City, a distance of about 10 miles.

ANNISTON, ALA.—A company has been organized to build an electric railway from Anniston to Camp McClellan. The company is capitalized at \$200,000 and as soon as permission is granted by the War Department to enter the reservation, work on the railway, it is expected, will begin. W. H. McKleroy is president and W. H. Weatherly is vice-president. James Mitchell, president of the Alabama Power Company, is interested in the company.

CHENEYVILLE, LA.—An election will soon be called to submit to the voters the proposal to issue \$16,000 in bonds for the installation of an electric-lighting plant and water-works system in Cheneyville.

NEW ORLEANS, LA.—Bids will be received by the lighthouse inspector, New Orleans, La., until June 21 for two 15-hp. kerosene engines, electric ignition; two air compressors, fuel, air and cooling tanks, etc. Further information may be obtained upon application to the above office.

RAYNE, LA.—Bonds to the amount of \$35,000 have been voted for improvements to the municipal electric-light plant and water-works system.

DENISON, TEX.—The construction of a new passenger station and repair shop in Denison, to cost about \$10,000, is under consideration by the Texas Electric Railway Company.

LUFKIN, TEX.—The Lufkin Electric Light & Power Company is contemplating the installation of additional machinery at its plant. The capital stock of the company has been increased from \$30,000 to \$45,000.

SWEETWATER, TEX.—Dr. A. W. Caulfield would like to receive information on an individual lighting system in connection with remodeled building for bathhouse and massage parlors and other buildings, comprising a sanitarium.

WACO, TEX.—The Waco Electrical Supply Company has increased its capital stock from \$20,000 to \$30,000.

WICHITA FALLS, TEX.—Bids will be received until June 25 by the State of Texas, W. P. Hobby, Governor, Austin, for the erection of buildings for the Northwest Texas Insane Asylum. Separate bids to be submitted on each building. Funds to the amount of \$385,000 are available for the work. Charles H. Page & Brother of Austin are architects.

Pacific and Mountain States

GROUND MOUND, WASH.—Bids will be received by the State Board of Control, Olympia, until June 21 for the construction of cottage and power house at the State School for Girls near Grand Mound. The power house with equipment will cost about \$15,000. Plans are on file at the above office and at the office of George W. Lawton, Alaska Building, Seattle.

LA CROSSE, WASH.—Local business men are considering asking the Washington Water Power Company of Spokane to take over the local electric plant and extend its electric transmission line from Endicott to La Crosse.

SEATTLE, WASH.—A permit has been granted to the Puget Sound Traction, Light & Power Company for the erection of a reinforced concrete smokestack, 225 ft. high, to cost about \$15,000.

SEATTLE, WASH.—The Heffernan Engine Works are rebuilding their plant and will install considerable new machinery. The company manufactures marine engines and deck equipment.

SEATTLE, WASH.—The Stone & Webster Engineering Corporation will begin

work at once on the construction of a power station for the Puget Sound Traction, Light & Power Company, to be located at 6500 Fourteenth Avenue, South Seattle, to cost about \$30,000.

SEATTLE, WASH.—Bids will be received by the Board of Public Works of Seattle until June 21 for furnishing one 1000-kw. motor-generator set for the City Light Department. This will be installed in the substation being erected to supply power to the Seattle municipal railway.

HOOD RIVER, ORE.—The Pacific Power & Light Company has recently completed a link in the high-voltage transmission line near White Salmon, Wash., connecting the Hood River and White River plants with the large plant of the Northwestern Electric Company on the White Salmon River. Energy is transmitted across the Columbia River over six cables.

PORTLAND, ORE.—Projects of the Portland Railway, Light & Power Company, involving an expenditure of \$1,550,000, have been approved by John R. Lewis, state engineer, to increase the power facilities in Portland by development of water rights on the Clackamas River. One of the projects approved is for the appropriation of 667 second ft. of water, together with the waters of the Clackamas River, for development of 10,000 hp. The proposed plans will involve the construction of a flume 4 miles long, with a power plant, to cost about \$1,250,000. Another application calls for the construction of the Timony Meadows reservoir on Oak Creek in Clackamas

County of 40,000 acre-ft. of water. This project includes the construction of a dam 80 ft. high and 440 ft. long, to cost about \$300,000. These projects were started by the company several years ago and later dropped.

LOS ANGELES, CAL.—The Pacific Electric Railway Company is contemplating the construction of an extension to Yucaipa as soon as possible.

OAKLAND, CAL.—The San Francisco-Oakland Terminal Railways Company is planning to build an extension to the Moore shipbuilding yards in Oakland.

ONTARIO, CAL.—The Ontario Power Company, which supplies electricity in Ontario and Upland, has petitioned the State Railroad Commission for permission to develop an additional source of power, which will necessitate an expenditure of about \$60,000. The company contemplates a hydroelectric development just above Hog's Back in San Antonio Canyon.

SAN DIEGO, CAL.—On May 21 connection was made between the Southern California Edison Company's transmission lines at San Juan Capistrano and the San Diego Consolidated Gas & Electric Company. The latter company is now purchasing a considerable part of its electrical energy from the Southern California company, this energy being generated by water power.

SAN FRANCISCO, CAL.—The Board of Public Works has awarded contract to the General Electric Company for furnishing and delivering electric locomotives at the Hetchy Hetchy site, at \$39,162.

MILFORD, UTAH.—Preparations are being made for the development of the sulphur mine northeast of Milford on the Beaver-Milford County line. The Beaver River Power Company of Beaver, it is understood, expects to erect an electric transmission line to the mine.

VERDI, NEV.—The power plant of the Verdi Lumber Company was damaged recently, causing a loss of between \$20,000 and \$30,000.

Canada

BURNABY, B. C.—The local stations of the British Columbia Electric Railway Company were recently destroyed by fire.

ELMIRA, ONT.—The Elmira Machinery & Transmission Company, Church Street, is planning to build an addition to its plant, to cost about \$50,000. E. Vice is manager.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing agents, the Panama Canal, Washington, D. C., until June 26 for furnishing cable, wire rope, brass tubing, porcelain insulators, bridge and aerial cable rings, signal gongs, etc., under circular 1220. Further information may be obtained at the above office.

(Issued May 14, 1918.)

1,266,435. **TELEPHONE INSULATOR**; Roy W. English, Victoria, B. C., Canada. App. filed June 30, 1917. Glass or porcelain insulators whereby the line wires can be securely gripped.

1,266,440. **TAP CONNECTOR FOR ELECTRIC CONDUCTORS**; Morris F. Finkelstein, New York, N. Y. App. filed May 22, 1917. Binds the connector to the cable in a simple, reliable and effective manner.

1,266,441. **ELECTRIC CONNECTOR**; Morris F. Finkelstein, New York, N. Y. App. filed May 22, 1917. In form of a duplex clamp.

1,266,460. **TROLLEY POLE**; Peder Hammer, Chicago, Ill. App. filed Jan. 13, 1917. Has means for locking the pole.

1,266,473. **ELECTRICAL MEASURING APPARATUS AND METHOD OF OPERATING THE SAME**; Charles A. Hoxie, Schenectady, N. Y. App. filed May 19, 1916. Includes a thermo-cell.

1,266,478. **METHOD OF PRODUCING SILICON-CARBIDE ARTICLES**; Otis Hutchins, Niagara Falls, N. Y. App. filed March 3, 1917. Uses electric furnace of the type ordinarily employed in the production of carborundum.

1,266,479. **FUSE**; Victor G. Jensen, Chicago, Ill. App. filed Sept. 18, 1916. Improved type of cartridge fuse.

1,266,480. **TRANSFORMER**; Svend E. Johannessen, Pittsfield, Mass. App. filed Dec. 11, 1915. Transformer terminal boards.

1,266,487. **TACHOMETER**; Petrus van Santen Kolff, Philadelphia, Pa. App. filed May 2, 1916. Electrical speed-indicating mechanism.

1,266,516. **HIGH-POTENTIAL INSULATOR**; Sadaji Momota, Tokio, Japan. App. filed June 14, 1916. To prevent creeping or surface discharge.

1,266,517. **RECTIFIER**; George S. Meikle, Schenectady, N. Y. App. filed Oct. 9, 1914. Improvements.

1,266,530. **TELEPHONE TRANSMITTER**; John Z. Miller, Erie, Pa. App. filed April 18, 1917. Improvements in the diaphragm.

1,266,727. **CIRCUIT CONTROLLER**; Thomas E. Barnum, Milwaukee, Wis. App. filed April 8, 1916. Provides contact-supporting means.

(Issued May 21, 1918.)

1,266,548. **ELECTRIC SWITCH**; Harry J. Bradley, Milwaukee, Wis. App. filed May 22, 1916. Relates particularly to that type which is operated magnetically.

1,266,555. **APPARATUS AND METHOD FOR OPERATING SWITCHES**; Roy W. Collins, New York, N. Y. App. filed May 13, 1913. Provides a switch automatically controlled by the condition of the motor circuit of an approaching car.

1,266,557. **FILM-FORMING ELECTROLYTE**; John Coulson, Wilkesburg, Pa. App. filed May 3, 1916. Provides an electrolyte which shall be capable of acting upon film-forming metals to produce dielectric films.

1,266,558. **PROTECTIVE DEVICE**; Elmer E. F. Creighton, Schenectady, N. Y. App. filed

Record of Electrical Patents

Notes on United States Patents

Feb. 17, 1915. Relates to protective devices for maintaining continuity of service on transmission lines under short-circuit conditions.

1,266,566. **BAROMETRIC VALVE**; Earl E. Eby, Wilkesburg, Pa. App. filed July 6, 1915. Relates to valves of the barometric type.

1,266,570. **MEASURING DEVICE**; Sidney W. Farnsworth, Pittsburgh, Pa. App. filed July 3, 1916. Means for accurately determining variations in temperature and pressure by the use of a resistor.

1,266,571. **COIL RETAINING AND VENTILATING MEANS**; Allan B. Field, Westcliffe-on-Sea, England. App. filed Feb. 5, 1914. Relates particularly to rings adapted for employment in the rotors of turbo-generators and similar machines.

1,266,573. **SHOTGUN**; George Fleming, Princeton, Tex. App. filed Jan. 18, 1917. Provides a trigger-operated gun which closes an electrical circuit.

1,266,575. **TERMINAL CONNECTION**; Richard H. Frank, Malta, Mont. App. filed May 24, 1917. Improvements in terminal connections, adapted for use with high-tension cable wires.

1,266,586. **SYSTEM OF CONTROL**; Arthur J. Hall, Wilkesburg, Pa. App. filed March 4, 1916. Provides a control system for the operation of the driving motors of an electric locomotive.

1,266,592. **SYSTEM OF CONTROL**; Rudolf E. Hellmund, Pittsburgh, Pa. App. filed March 4, 1916. A means is employed for effecting a uniform rate of deceleration of momentum-driven dynamo-electric machines.

1,266,593. **CONTROL SYSTEM FOR ALTERNATING-CURRENT COMMUTATOR-MOTORS**; Rudolf E. Hellmund, Pittsburgh, Pa. App. filed March 13, 1916. Provides a system whereby the motor may be started and accelerated in a smooth and uniform manner with ample torque.

1,266,599. **CARTRIDGE FUSE**; Alfred E. Johnson, Denver, Col. App. filed Dec. 20, 1915. Divides the interior of the cartridge into two compartments by means of a partition.

1,266,604. **ELECTRICAL MEASURING INSTRUMENT**; Paul MacGahan, Pittsburgh, Pa. App. filed April 29, 1915. Relates to power-factor meters for polyphase electric circuits.

1,266,607. **CONTROL SYSTEM**; Paul L. Marquis, Altoona, Pa. App. filed May 3, 1915. Relates to control systems for dynamo-electric machines and to four equipments of the series-parallel type.

1,266,614. **SEAL**; Harold A. Newcomb, Wilkesburg, Pa. App. filed Jan. 6, 1915. Relates to gas-tight seals between glass and metal.

1,266,615. **INSULATOR CLAMP**; David S. Nicol, Quebec, Canada. App. filed July 23, 1917. Insulator clamps securable to the large insulator of power-transmission line for supporting air-break switches, lightning arresters and the like.

1,266,623. **TELEPHONE SIGNALING SYSTEM**; Ralph K. Quess, New York, N. Y. App. filed July 1, 1916. Relates to a system of the type in which automatic switches are employed for controlling the connecting and signaling circuits.

1,266,630. **AUTOMATIC-DUMPING TRANSPORT SYSTEM**; William Ross and Walter F. J. Cosser, South Porcupine, Ontario, Canada. App. filed June 4, 1917. Relates to transport systems in which dump trucks provided with outlet doors run on suitable rails.

1,266,612. **AUTOMATIC MOTOR STARTER**; Herman L. Van Valenburgh, Milwaukee, Wis. App. filed Aug. 21, 1916. Device will automatically control the circuit relations of the different sections of starting resistance.

1,266,615. **TELEPHONE-EXCHANGE SYSTEM**; Harry G. Webster, Chicago, Ill. App. filed May 29, 1914. Consists in the provision of improved means for automatically extending a calling line to an idle operator.

1,266,652. **ELECTRICITY METER**; Jacob W. Bard, Springfield, Ill. App. filed June 7, 1915. Relates to direct-current watt-hour meters of the mercury motor-meter type comprising a rotating armature immersed in a mercury bath.

1,266,811. **TELEGRAPHIC RECEIVER**; Edwin W. Mayfield, Chicago, Ill. App. filed May 29, 1916. Improved means for receiving telegraphic signals with speed and secrecy and at a minimum of discomfort to the receiving operator.

1,266,879. **ELECTRICAL HEATING APPARATUS FOR PERMANENTLY WAVY HAIR**; Eugene F. Suter, London, England. App. filed Aug. 6, 1917. An improved electrical heater arranged so that the heat can be applied to and distributed over the different parts of the coiled hair.

1,266,887. **CONDUIT CAP FOR ELECTRIC INSTALLATION**; Wheeler H. Vibber, New London, Conn. App. filed Nov. 28, 1916. An improved conduit cap for use as an end terminal for electric installation.

1,266,897. **CIRCUIT CONTROLLER**; Paul H. Zimmer, Milwaukee, Wis. App. filed April 8, 1916. Circuit controllers adapted for starting alternating-current motors.

1,266,898. **ELECTRICAL SYSTEM**; Carroll R. Alden, Detroit, Mich. App. filed Feb. 4, 1916. A simple and efficient means for controlling the resistance of ignition circuits.

- 1,266,911. VACUUM FOR ACCUMULATING BATTERIES OR THE LIKE; Georges Boulton, Paris, France. App. filed Dec. 10, 1917. Relates to an arrangement which simplifies the fitting and facilitates the cleaning of the various parts.
- 1,266,917. ALTERNATING CURRENT SOLENOID; George A. Burnham, Saugus, Mass. App. filed Sept. 28, 1916. A form of solenoid adapted to be associated with a circuit breaker or switch.
- 1,266,920. SIGNAL BOX HAVING LOCAL ALARM; Frederick W. Cole, Newton Highlands, Mass. App. filed April 19, 1915. Improved means whereby a local alarm or bell is sounded at the box concurrently with the actuation of the mechanism for transmitting the signal.
- 1,266,931. POLARITY-INDICATING MECHANISM FOR X-RAY APPARATUS; Charles Payser, New York, N. Y. App. filed May 18, 1916. Relates to X-ray apparatus in which a high-potential current discharge is sent through an X-ray vacuum tube.
- 1,266,941. ELECTRICAL HEATING APPLIANCE; Cedric E. Heller, Milwaukee, Wis. App. filed Oct. 26, 1917. Provides means whereby any gas range may be readily converted into an electrical range.
- 1,266,978. TELEPHONE EXCHANGE SYSTEM; Roy E. Noble, New York, N. Y. App. filed Nov. 6, 1916. Extension telephone lines terminating at a private branch exchange may make outgoing calls during the period when no operator is at the private branch exchange.
- 1,266,979. PLUG; George W. Norgate, Chicago, Ill. App. filed June 16, 1914. Relates to plugs or connecting devices adapted to establish circuit connections with the customary form of threaded socket.
- 1,266,988. AMPLIFYING RECEIVER; Edwin S. Priddham and Peter L. Jensen, Napa, Cal. App. filed July 3, 1916. Receivers of this type of conducting coil for telephone currents disposed in a magnetic field so as to cut transversely the lines of force of the field.
- 1,267,013. TRANSFORMER; Chester M. Thornderson, Chicago, Ill. App. filed Sept. 27, 1915. Means for adjusting transformer to potential drops along the transmission line.
- 1,267,018. TRANSMITTING APPARATUS FOR WIRELESS TELEGRAPHY AND TELEPHONY; Georg von Arco and Alexander Meissner, Berlin, Germany. App. filed March 6, 1914. A transmitting station for wireless telegraphy and telephony in which the high-frequency currents are produced in a generator switch.
- 1,267,031. TELEPHONE TRUNK CIRCUITS; Bernard D. Willis, Chicago, Ill. App. filed Aug. 23, 1916. Interoffice trunk circuits for use in automatic telephone systems.
- 1,267,044. ELECTRIC WATER PURIFIER; Edward M. Barnes, Hastings, Mich. App. filed June 30, 1917. Provides an electric water purifier of type in which spaced electrodes are immersed in the water to be purified.
- 1,267,060. ELECTRIC HORN; William W. Dean, Chicago, Ill. App. filed Oct. 15, 1913. Improvements in electric signal horns or alarms.
- 1,267,068. RECORDER FOR TELEGRAPH MESSAGES; Reid G. Ford, Brooklyn, N. Y. App. filed Jan. 21, 1916. Consists in mechanism connected with the sending instrument by which a complete record of all messages sent is automatically taken.
- 1,267,069. ELECTRICALLY CONTROLLED TEMPERATURE REGULATOR; Henry W. Grom and Frederick Terry, Pasadena, Cal. App. filed June 14, 1917. Relates to an electric contact switch and a thermostatic control therefor.
- 1,267,097. AUTOMATIC TELEPHONE SYSTEM AND APPARATUS; Talbot G. Martin, Chicago, Ill. App. filed March 26, 1907. Relates to automatic systems in which step-by-step actuated and electrically propelled switches are employed for extending connections to systems.
- 1,267,104. HEAT - CONTROLLING DEVICE; Henry A. Moore and Albert H. Brunner, Burbank, Los Angeles, Cal. App. filed Dec. 6, 1916. An electrical thermostatic control adapted for use in incubators and the like.
- 1,267,113. PARTY-LINE TELEPHONE SYSTEM; Winfred T. Powell, Chicago, Ill. App. filed April 27, 1916. Automatic party-line telephone systems in which connections are established through the medium of subscriber-controlled switches.
- 1,267,120. ELECTRODE; Ferdinand A. Rudolf, New York, N. Y. App. filed Aug. 15, 1916. Provides suspended electrodes of such construction that the loss of

precious metal values in the refining process is practically eliminated and the deposit of the desired metal is substantially pure.

- 1,267,131. AUTOMATIC OR SEMI-AUTOMATIC TELEPHONE SYSTEM; Arthur E. Smith, Evanston, Ill. Has for its object the provision of a system in which phantom circuits are employed for establishing connections.
- 1,267,141. TOTALLY SUBMERGED ELECTRODE; Harry G. Stout, New York, N. Y. App. filed July 26, 1916. Forms the plates and constructs the tanks in which the plates are held so that all the plates are totally submerged beneath the electrolyte when in use.
- 1,267,148. IGNITION MECHANISM FOR INTERNAL-COMBUSTION ENGINES; Harry Randolph Van Deventer, Sumter, S. C. App. filed Dec. 19, 1914. Has for its purpose the provision of an igniter bracket upon which a magneto may be mounted.
- 1,267,156. CONTACT-MAKING VOLTMETER; Fred H. Winter, Schenectady, N. Y. App. filed March 1, 1917. Relates to contact-
- making voltmeters in which electromagnetic holding means are employed to prevent chatter of the contacts.
- 1,267,165. FIRE-ALARM PROTECTIVE DEVICE; Mario Arnava, San Francisco, Cal. App. filed July 24, 1917. Relates to that class of fire-alarm signal stations in which a booth is provided having a door automatically locked.
- 1,267,173. ELECTRIC HEATING DEVICE; Arthur Francis Berry, Ealing, England. App. filed Nov. 28, 1916. An electric heating device comprising a grid-like structure.
- 1,267,181. ELECTRIC CIRCUIT-CONTROLLING SWITCH; Frank J. Camatta, Tonasket, Wash. App. filed Feb. 7, 1916. A cut-out switch for use in connection with electric current meters.
- 1,267,198. ELECTRIC METER; Evan Evans, Berlin, Germany. App. filed Feb. 10, 1914. A type of electric peak meter in which the armature is subjected to a constant counter-torque corresponding to a definite and predetermined rate of consumption of energy.
- 1,267,199. INCANDESCENT-CATHODE ARC DEVICE; Charles V. Ferguson, Schenectady, N. Y. App. filed Sept. 20, 1915. Relates to electrical discharge devices of the incandescent cathode type having a gaseous filling.
- 1,267,213. DEMAND-LIMITING APPARATUS; Chester I. Hall, Fort Wayne, Ind. App. filed April 26, 1916. Provides a demand-limiting device which will interrupt or modify the current flow in an electric circuit.
- 1,267,214. POSITION INDICATOR OR RECORDER; Chester I. Hall, Fort Wayne, Ind. App. filed June 15, 1916. Devices for reproducing or indicating the movement of a primary movable member at some point more or less remote from the primary member.
- 1,267,216. MOTOR CONTROL; Williams S. H. Hamilton, Schenectady, N. Y. App.

1,267,338—Trolley Wheel

- filed July 6, 1917. Relates to multiple-unit control of the pilot motor type.
- 1,267,222. SAFETY TOP FOR SWITCHES; Charles H. Hill, Schenectady, N. Y. App. filed Nov. 13, 1915. A safety device for knife-blade switches to prevent them being closed accidentally.
- 1,267,223. PROTECTIVE DEVICE FOR TELEPHONE CIRCUITS; George H. Hill, Schenectady, N. Y. App. filed Nov. 13, 1915. A device which will automatically ground the telephone wires and will also interpose a positive barrier at the entrance to the telephone jack so that the telephone plug cannot be inserted.
- 1,267,232. MOTOR WINDING; Willem C. Korthals-Altes, Schenectady, N. Y. App. filed March 16, 1916. An improved arrangement of the stator winding for three-phase motors.
- 1,267,247. ELECTRIC COUPLING; Herbert D. Meeker, Niskayuna, N. Y. App. filed June 16, 1914. An automatic electric coupler designed for use upon moving vehicles arranged as trains.
- 1,267,251. METHOD OF MAKING METAL RINGS; Thomas R. Murray, New York, N. Y. App. filed Nov. 1, 1917. Making metal rings from flat bars or plates of metal in such a way that the ring when completed will be truly circular.
- 1,267,254. ELECTRIC WELDING MACHINE FOR MAKING METAL RINGS; Thomas E. Murray and Harry E. Woodrow, New York, N. Y. App. filed Dec. 10, 1917. Refers particularly to making rings or other endless shapes of metal.
- 1,267,255. APPARATUS FOR MAKING METAL CHAINS; Thomas E. Murray, New York, N. Y. App. filed Dec. 29, 1917. The apparatus comprises electrodes constructed to hold the link sections in suitable grooves in their opposing faces.
- 1,267,256. METHOD OF AND APPARATUS FOR ELECTRIC WELDING; Thomas E. Murray, New York, N. Y. App. filed Jan. 21, 1918. Apparatus for producing a projectile having means for guiding the same during flight.
- 1,267,258. ELECTRICAL WELDING APPARATUS FOR PIPE COUPLING; Thomas E. Murray, New York, N. Y. App. filed Feb. 16, 1918. Apparatus for welding reinforcing rings to pipe couplings.
- 1,267,259. METHOD OF AND APPARATUS FOR ELECTRIC WELDING; Thomas E. Murray and Joseph B. Murray, New York, N. Y. App. filed March 9, 1918. An apparatus comprising two electrodes and means for simultaneously preventing lateral expansion of both of said electrodes during the welding operation.
- 1,267,266. ELECTRICAL MEASURING INSTRUMENTS; Willard E. Porter, Lynn, Mass. App. filed May 26, 1916. Instruments of the D'Arsonval type.
- 1,267,273. SEAT INDICATOR FOR THEATERS; Harry L. Rogers, Philadelphia, Pa. App. filed Sept. 17, 1915. Provides an indicator associated with each row of seats in a theater, the indicator being placed on the end of a row at a point so as to be seen from the rear of the building.
- 1,267,293. GUN; James G. Veteto, Amity, Ark. App. filed Oct. 15, 1917. Provides a magazine gun adapted for firing electric cartridges.
- 1,267,317. ELECTRIC GLASS FURNACE; John O. Erskine, Steubenville, Ohio. App. filed Nov. 21, 1917. Provides a glass-melting furnace or tank wherein the heat employed is produced by the conversion of electrical energy.
- 1,267,324. AUTOMATIC MOTOR STARTER; Hubert F. Krantz, Brooklyn, N. Y. App. filed Feb. 18, 1916. Provides an automatic device governing the lapse of time before the current is taken through the motor fuses.
- 1,267,338. TROLLEY WHEEL; John Longenecker and L. G. Stockberger, Hiram, Ohio. App. filed April 4, 1917. An improved wheel for the transmission of electricity to vehicles, the wheel comprising two sections.
- 1,267,342. CURRENT-COLLECTING DEVICE; Thomas W. Varley, New York, N. Y. App. filed Oct. 3, 1913. Provides a current-collecting or brush device that shall have a visible means for indicating the relative pressure of its brushes.
- 1,267,347. PROCESS OF ELECTRICAL REDUCTION; Charles H. Fulton, St. Louis, Mo. App. filed July 25, 1917. Consists in mixing a reducing agent with the substance to be reduced so as to form a loose granular mixture.
- 1,267,349. DRY-CELL BATTERY; Ralston F. Smith, Cleveland, Ohio. App. filed Jan. 4, 1918. Provides a dry-cell battery construction which will be economical of manufacture and will embody in the performance of its function a maximum of efficiency.

Commission Control of Power Supply

ESTABLISHING a priority list for power consumers was the onerous task that suddenly loomed before the California Railroad Commission. Even under the most favorable conditions the arbitrary announcement of who might and who might not buy power would be sure to develop opposition and probably litigation. Fortunately a better plan has been developed, and although some California industries may later suffer curtailment, they will first have an opportunity to co-operate in the reduction of waste, and in the event that further restriction becomes necessary will still have the right to a final hearing before the Power Administrator. If arbitrary action had been taken, there would remain to be settled the question of whether a priority list could be legally enforced when opposed on the grounds of confiscation. Should litigation be instituted by consumers, it will be handled by the commission and not by the power companies. However, litigation is unlikely under the plan of transferring power conservation problems to a separate bureau under the direction of an administrator. The plan has the advantage of enlisting the interest and co-operation of all affected parties and establishes a precedent for action by state utility commissions in line with the policy being followed by federal bureaus.

Our Marines the Devil Hounds

WITH this issue each reader will receive a copy of a war poster, "Our Marines." Newspaper dispatches recounting the exploits of these men in France say they fought so tenaciously and to such good effect that the enemy nicknamed them "the devil hounds." This, of course, is very gratifying to us at home; but if these men are to persist and conquer, we here must do our part, not only in keeping them supplied with war materials, but in hounding the devil at home no matter in what shape he appears. Otherwise our sacrifices may be to no avail. The world-German war has resolved itself into an economical and technical strife. Not that our ideals are one whit less righteous, but that technical experience and professional skill are now as important as military perfection. Of every man possessing a technical education a peculiar service is expected. First, the government needs engineers in various branches of the service both at home and abroad. Then it expects that those great economies which only skilled engineers can produce will be forthcoming in this country and that engineering thought

will be concentrated on the problems with which we are confronted abroad. Efficiency is as much a requisite to our national life as it is to our national salvation, and the greatest proponents of efficiency are our engineers.

Respond Promptly with Facts on Rates

TWO points bearing on the public utility situation stand out clearly in the discussion and negotiations of the times. One is that the utilities are not entirely self-governing and they cannot, therefore, solve their problems by their own independent action; they must have sympathetic co-operation from the outside. The other is that if no authority will take the definite responsibility of helping the utilities, if every constituted authority is to go on the mistaken theory that while the thing ought to be done, some one else ought to do it, the utilities are in a sad plight of orphanage.

Legally the authority and the responsibility rest largely, if not entirely, upon the state or municipal officials who are the regularly constituted supervisory powers in public utility matters. But it is very far from a purely legal issue, for the condition of war gives the federal government usurping powers which it is using in its best judgment to carry on to victory. In the federal government program a new standard of importance is set up, and questions become of major or minor rank according as they have to do definitely with winning the war or with matters of, for the time being, less consequence. We must as one nation work all elements co-operatively. It is necessary for the federal government to segregate these questions in every detail of its program, and no one would have it otherwise. It is equally desirable that state and municipal authorities should concur in the national program. The utilities constitute at this time an issue which positively touches the war program, and they are in real need of consideration as vital elements in the conflict.

President Wilson turned aside from his other heavy burdens of care to say: "It is essential that these utilities should be maintained at their maximum efficiency and that everything reasonably possible should be done with that end in view." We urge any lukewarm individuals to observe closely that the President, a master of English, said "essential." Not "desirable," not "important," not a mere matter of routine to be attended to if there was no other business pending, but *essential*. And he said "maximum efficiency"; he is satisfied that simply to run the plant in any old way

would not whip the enemy. And the other striking phrase of President Wilson's letter to Secretary McAdoo is just as impressive: "I hope that state and local authorities, where they have not already done so, will, when the facts are properly laid before them, respond promptly to the necessities of the situation." This puts the obligation, so far as the President can do it, squarely up to the utilities to lay the facts before the constituted rate-regulating authorities. And he would have the authorities respond, not after a delay of two or three years shall have let the emergency grow cold, not when the patient is ready to inter, but *promptly*.

With the moral support of the President, Secretary of the Treasury McAdoo and Comptroller of the Currency Williams, the state commissions and local authorities have not the shadow of an excuse for inaction. They know that electric rates have gone down for years; they know that costs have gone skyward under war conditions; they know that the result is one which no prudent business man or householder would regard calmly in his own affairs. It is right up to the rate-regulating authorities to do their part in keeping these invaluable public servants at the high mark of efficiency.

We declare that in the main the electric utilities which need help have laid or will lay the facts "properly" before the authorities. Their managers know full well that they are more than a cog in the war machine; they are a prime driving power in that machine. They are not asking that things which are not so shall be taken as facts; they ask only that the high costs which are as prominent as the nose on a man's face shall be recognized as elements in rates.

A Suggestion for Fuel Economy

THE necessity of the utmost economy in the use of fuel is gradually being brought home to all operators. Through all of the discussion before the convention of the N. E. L. A. last week that thought was constantly recurring.

Exactly in line with various recent discussions of fuel economy was the description by L. A. Stenger in the *ELECTRICAL WORLD* of May 25 of experiments on the combustion of coals carrying large quantities of dust. Everybody is getting at present about such coal as is available, and no one can longer count on selected high-grade fuel of uniform size. Mr. Stenger's experiments were directed chiefly to the air flow through fuel beds composed, on the one hand, of clean coal and, on the other, of coal carrying much dust, meaning by dust particles up to $\frac{1}{8}$ in. (3.2 mm.) in diameter. Although the general effect of dust in choking air supply is familiar, the extent to which it may do this and the disastrous effect on efficiency, as disclosed by Mr. Stenger's figures, are somewhat surprising. The immediate effect of dust, particularly if it settles in layers and is not uniformly disseminated, is to choke the passage of air so much that the combustion in ordinary furnaces is very unsatisfactory. Wetting the coal aggregates the dust in lumps or attaches it to the larger pieces of coal so that the particles no longer pack and obstruct the air. Even after drying so much of the dust sticks together and to the rest of

the coal that the aggregate burns more freely than before wetting.

The most striking effect brought out was the degree to which dust injures the fuel efficiency. One of the experiments showed that a dust-free coal of only 9900 B.t.u. gave much better results than a dusty coal of 12,000 B.t.u. Of course, in suitably designed furnaces one can burn almost any kind of fuel with fair economy, but in attempting to fire dust-bearing coal in ordinary furnaces there is certain to be considerable loss. Even under very favorable circumstances the dust is still an embarrassment in obtaining efficient combustion. Poor combustion means not only lowered efficiency but lower boiler capacity. Mr. Stenger's suggested remedy for dealing with this troublesome matter is simple and in plants of considerable size ought to work out very well. It is merely to crush the coal as received to a uniform rather small size and then to screen out thoroughly the dust. The crushed coal would then be used in the ordinary furnaces, while the dust would be pulverized and fed to boilers equipped with suitable combustion chambers as indicated recently in these columns. In this way the dust instead of obstructing the combustion of the normal coal would itself be burned at an efficiency quite up to all that its B.t.u. value should imply.

Building a Mountain Transmission Line

THE topography of our western coast country is a constant stimulus to the constructing engineer. He there has to meet conditions of very various and troublesome character within a comparatively short space, and he has generally succeeded admirably in rising to the situation. A thoroughly typical case of the unusual things that have to be done in the Pacific Coast transmission systems is described in our current issue. The great solar observatory on Mount Wilson needed power in excess of the modest amount which could be furnished from its original oil-engine-driven plant. The peak is somewhat more than a mile high. Oil as well as all the other supplies had to be hauled to the top, and in winter the road is sometimes impassable. Therefore it became necessary to tap a power circuit, and the nearest available one, belonging to the Southern California Edison Company, was a 15,000-volt circuit about seven miles (11.2 km.) away in an air line, most of the distance being over mountain tops and wild canyons. So over peaks and canyons the line was carried, and because of the contour of the country the larger part of it was strung in spans averaging more than 2000 ft. (914 m.), sweeping over canyons and carried at sharp pitches up the mountain side.

As the amount of power to be transmitted was not large, the line conductors are of 5/16-in. (7.9-mm.) seven-stranded steel cable. The weight of the up-hill long spans being too severe for ordinary insulators, the line was carried on three regular strain insulators in series, which gave an ample factor of safety both in mechanical strength and in insulating power. As a still further efficient innovation, these long and difficult spans are supported at the ends by three 40-ft. (12.19-m.) wooden poles in tandem, heavily guyed. The trail was so crooked that these had to be transported, with the tops well pitched into the air on a trestle carried by the truck, otherwise they could not have

made the curves. Our illustrations give a vivid idea of the efficient resourcefulness of the engineers of the Southern California Edison Company, who built the line. The power transmitted is received at a substation at the observatory, where it is converted into direct current for use in the delicately controlled motors necessary for the observatory service. It only needs to be added that the line has been in operation six months and has gone through several severe storms without the slightest difficulty. So much for the temperament that makes its own precedents.

Methods of Protective Lighting

AS OUR war industries increase in volume and importance there is added risk of malicious interference with them by the enemy, whether aliens who have escaped internment or alleged neutrals who make it their business to interfere with the production of war materials. The old adage that an arc lamp is as good as a policeman is one constantly to be borne in mind in the protection of war plants against criminal malice. Mr. Magdsick's article on this subject last week excellently summarized the methods which have been found most practical in dealing with the somewhat intricate problem of protective lighting. They followed closely the suggestions of Mr. Leigh of the Military Intelligence Bureau, who has made a specialty of this plant protection and is at the head of that work for the government. Broadly, the dangers to an industrial plant are either external or internal. The external dangers are chiefly those concerned with arson, and incidentally with the damage of finished material within reach by any available means. These external dangers are, on the whole, the more serious because of the greater opportunity for mischief on the part of the workmen actually employed in the plant than on the part of outsiders seeking to break in. Most of the damage that has been done, and it is very serious in the aggregate, is chargeable to what the police call "inside jobs," ranging from sabotage to fires and explosions. Only when the strong arm of the law falls heavily upon the enemies of production will this condition cease.

For protection against damage from the outside, good lighting around buildings and yards, bright enough to disclose quickly the presence of interlopers, is all important. Just how it can best be carried out depends very largely on the local situation. The two general schemes of operation are by means of floodlamps and powerful distributed sources in suitable reflectors. To what extent each of these should be employed depends on the nature of the area to be guarded and the scheme for guarding it. Immediately around buildings there is probably nothing better than well-

placed large incandescent lamps in reflectors adapted to light the buildings without throwing too much glare in the eyes of the guards. The task of lighting industrial buildings is rendered much easier if they are not too dark in hue, a light-colored concrete, for instance, being very much better than brick. The chief usefulness of floodlamps is in reaching out and illuminating long approaches, extensive stretches of protecting fence and other spaces where for one reason or another it is inconvenient to place lamps, or for that matter to locate guards. A guard under or behind a floodlamp gets an admirable view of its illuminated track. Unless the lamp be placed fairly high he may be bothered by the glare if executing a patrol through the illuminated region. In general it would seem most practical to use floodlamps with guards placed with reference to the lamps rather than to the space lighted. Of course, along water fronts and similar situations floodlighting is likely to do excellent service.

Inside lighting needs to be thorough rather than very brilliant. The chief thing is to have no dark corners where an evilly disposed person may lurk out of the watchman's view. The interior must be lighted so that, either by direct illumination or by seeing a silhouette against the light, a guard may spot instantly the presence of any unauthorized person. For the inside protection lighting therefore big lamps are not essential or generally desirable, but rather well-distributed lamps so placed as to cast no troublesome shadows and to free the eye from glare. In general, then, proper protective lighting is likely to consist of illumination of boundaries and approaches either by distributed lamps or carefully placed floodlamps as convenience may dictate; lighting of the buildings themselves chiefly by moderately powerful units placed high to avoid glare, and, finally, inside illumination well distributed, of moderate intensity and designed with special reference to the avoidance of shadowed spaces which interfere with the watchman's vision. On the whole, the interior lighting is practically quite as important as the exterior.

Storing Coal for Next Winter

SINCE only by constant repetition does a thought finally become fixed, we again bring up the subject of the storage of coal. Elsewhere in this issue there appears a letter from the Fuel Administration which speaks for itself. Dr. Garfield is also quoted as saying that there will be lightless nights and heatless days this coming winter. The coal shortage is a very real thing, and all prudent men will heed the warning. Central-station companies cannot afford to be negligent in this matter. If they can get coal, they should by all means do so and store it to the limit of their resources.

IN THE next issue there will appear abstracts of the papers to be presented at the Atlantic City convention of the American Institute of Electrical Engineers, which is to be held on June 26, 27 and 28. An article by James R. Cravath outlining some of the central-station commercial possibilities contingent on the coal situation

The Coming Issues

will soon appear, as will a short description of two government nitrate plants now in the process of erection and a discussion of the relation of the war to power factor. There is also scheduled an article on utility rates. These will be in addition to the regular operation and commercial and management sections of the paper.

John W. Lieb's Presidential Address

Discussing "The Electrical Industry in War Service," the Retiring President of the National Electric Light Association Expresses in Vigorous Terms Our Determination to Support the War Program

The address of President Lieb "with singular clearness and in the broadest spirit reflects the attitude of the association and its members toward the great problems which are confronting our country at this crisis in the world's history.

"It is clearly our duty, as he so admirably indicates, to use every possible human effort, to make every sacrifice and to devote our time to the supreme business of the moment—the winning of the war, to the successful conclusion of which every true American should be pledged."

[From the report of Samuel Insull, Joseph B. McCall and Charles L. Edgar, the committee on the presidential address of Mr. Lieb, made before the annual convention at Atlantic City on June 13 and 14.]

"A YEAR ago last May, after a long period of patient endurance of unfriendly provocations and brutal violations of international agreements," began Mr. Lieb, "our country decided to draw the sword and come to the support of the gallant nations, now our heroic allies, who for three long years had been fighting desperately against a powerful and conscienceless enemy. No nation ever unsheathed the sword with greater reluctance, with greater justification and in the defence of nobler ideals. We were certainly not the aggressors, and we entered the fight with a clear conscience animated by a righteous purpose.

"It has taken us a whole year to appreciate the nature of the titanic struggle that is taking place overseas, 3000 miles away, and we are only just beginning to visualize the part we are called upon to play and the aid we must render to bring this terrible conflict to a victorious conclusion. Our industry was not slow to recognize the active and important service which it would be called upon to render, and at its annual meeting shortly after the declaration of war it made ready for an immediate mobilization of its resources to give every possible assistance to the government.

"As we look back upon the year that has been spent so largely in the work of preparation for our active and telling participation in the conflict, we may find some basis for faultfinding and criticism, but if we take a broadminded survey of the whole field and consider all the circumstances and conditions surrounding our national life, we must come to the conclusion that what has been accomplished is nothing short of miraculous; and we have reason to marvel at the stupendous scale on which the deep and broad foundations have been laid for a structure adequate to support the temple of victory which, in co-operation with our valiant allies, we shall rear no matter at what sacrifice of life and treasure."

EXTENT OF THE INDUSTRY

Mr. Lieb then showed the great extent of the wider electrical industry and of the electric light and power portion. Including the electric railway, the telephone and telegraph systems, the electric light and power systems and the manufacturing enterprises on whose output these enterprises are dependent for their apparatus and equipment, the industry gives employment

to over 920,000 men, represents an invested capital of about \$10,750,000,000 and an output valued at \$2,675,000,000 per year. The most recent statistics available indicate that in the electric light and power branch of the industry there are employed approximately 125,000 men with an invested capital of \$3,000,000,000 and doing an annual business of roughly \$575,000,000.

INTERCONNECTIONS

The first of the important problems discussed by Mr. Lieb was the interconnection of the regional generating and transmission systems. In discussing this he said:

At the present time there is imperative need that our member companies take an advanced position in this matter, as they have done in so many other directions, in order that every possible advantage may accrue to the nation and its war necessities.

Where demonstrable economic and service advantages are obtainable from such a plan of operation, if the utility companies themselves do not take the initiative in their consummation it will surely be done under some form of governmental control, as the nation must obtain for itself in these times all the advantages which may contribute notably to the solution of the one great aim and object of all enterprises and business at present—the winning of the war!

The member companies of this association . . . conspicuously among all the national industries have known how to obtain from their employees the enthusiastic loyalty and co-operation which have been the foundation of the high standards of service they have been able to maintain and on which their prosperity and the good will of the public which they enjoy have been largely built up. This devotion to duty of the employees is an essential prerequisite also to successful co-operation between extensive interconnected systems.

GENERAL ECONOMIC CONDITIONS

In citing the general facts as to the increase in cost of rendering service, Mr. Lieb commented: "Every other industry in the country, with the conspicuous exception of the steam railroads, has been able to meet similar conditions by an increase in the price of its product, and we have therefore experienced increases of 100 to 200 per cent and even more in the cost of all natural and manufactured products."

Discussing commission control, he added:

The commissioners have not shown the flexibility and alacrity in raising rates that they have become accustomed to show in the almost continual process of lowering them during the past decade.

But it is not only the shareholders that have seen a curtailment of their return on their investments and the deterioration of their property; the public also has suffered in impaired service, in curtailment of facilities and in the inability of utilities to provide funds for extensions and expansion to meet the demands of the public for additional service.

The situation is most serious and requires the earnest and urgent consideration of the national government.

The extraordinary conditions under which the electrical industry is now operating should call for the most liberal and responsive treatment of the applications for service which are overwhelming many utilities for such important

war service as navy yards, arsenals, shipbuilding, munition and nitrate plants, cantonments, etc.

It is not only difficult to finance these extensions, but the apparatus and supplies are hard to get; their cost is double and treble pre-war prices, labor is scarce and demands continually higher compensation, with the result that generating plants are becoming overloaded and the transmission and distributing circuits inadequate. Moreover, many of these demands for service are of a temporary character, often difficult to define as to amount and duration of service required, for which, particularly in direct government service, guarantees as to revenue to be expected are not obtainable. On the whole, the utilities throughout the country have responded splendidly to the demands made upon them.

It is not, however, amiss at this time to issue an appeal to every central-station company in the country to go to the very limit of its power in meeting the urgent requirements of the government and to respond in a spirit of patriotism and sacrifice to the needs of the nation.

COAL PROBLEMS

Utility managers, said Mr. Lieb, are looking forward with much concern as to what the coming winter may have in store for them on the serious problem of adequate coal supply. Discussing the causes, Mr. Lieb said in part:

It was indicated by some authorities that the coal famine was due to a shortage of labor at the mines; by others the reason assigned was lack of coal cars; by others it was attributed to a breakdown in the transportation system, and again it was held that the seat of the trouble was at the railroad terminals at tidewater. A more conservative opinion assigned a cumulative cause, in which each of these factors played a constituent part of greater or less importance, some being the relation of cause and effect.

It would require a more searching investigation than any that has yet been made to determine the effect which the prices fixed at various times by the government or previously by voluntary agreement had on the coal mined. But the difficulties experienced were not alone from scarcity of coal but also from the irregular and generally inferior quality.

In discussing the efficiency of central-station plant operation, Mr. Lieb expressed the opinion that it will be impracticable to obtain at this time any noteworthy improvement in power-house fuel economy from any radical improvement in operating methods, as a measure of fuel conservation. He continued:

The outlook for savings in other directions is not, however, quite so discouraging. There are certain possibilities in the saving of fuel from the joint operation of neighboring plants which may, through "linking up," improve their load factor and utilization factor and achieve economies due to the operation of the most efficient units of both plants the bulk of the time, and the operation of the most efficient units fully loaded in one of the plants the remainder of the time. It must not be assumed, however, that it will always be found easy to carry out such interconnection, for the outlying districts of each, if joined, will hardly permit considerable interchanges of current, and the extension of tie lines into sections of sufficient capacity will require an engineering study of each individual case.

Much has been said and written recently of the possibilities of joint operation between central-station systems and isolated or private plants operating within the same territory. It does not need demonstration that the coal consumption in the isolated plants is generally from two and a half to four or five times the amount of coal required to produce the same quantity of electrical energy in the central station. The private plant usually requires more or less steam for heating or for the operation of auxiliaries, which may be obtained wholly or in part from the live steam of the boilers supplementing or taking the place of the exhaust steam. These figures would in such cases be somewhat dependent in their relative values upon the conditions presented by each individual case; but the fact re-

mains that on the whole there would be a notable coal saving in the operation of all the requirements throughout the territory for light and power from the central electric station with local steam heating for individual cases where it cannot be obtained from a central heating system.

Consideration has also been given to the joint operation of the street system and the private plant, but this plan presents such practical and economic difficulties that it can hardly be considered practicable.

PREVENTING WASTE

Showing that the companies fully co-operated in enforcing sign-lighting restrictions, Mr. Lieb, after mentioning the industrial curtailment, called attention to the daylight saving law, which he urged be made operative all the year.

Development of our stupendous unused national asset in water powers was urged by Mr. Lieb.

Consumers should be advised, Mr. Lieb said, to use "every care not to waste light and to avoid excessive and unnecessary use of light in interiors and limit to reasonable proportions the use of advertising, display and purely decorative exterior illumination.

"As to the use of carbon and 'gem' lamps, it has been found that while the demand for these less efficient types is constantly decreasing, there is still a certain demand for these lamps and particularly for the least used carbon lamps for particular services, such as in construction work, garage and inspection use, etc., where only the more robust carbon filament is able to resist the effects of vibration and rough handling."

LABOR CONDITIONS

Calling attention to the great rush of enlistment and volunteering and to the calls of the National Army, Mr. Lieb said that it was not these that caused serious concern, but the withdrawal from service in response to the inducements offered by munition factories, shipbuilding plants, navy yards, power factories, nitrate plants and the construction camps of cantonments, warehouses, etc.

Expressing sympathy for the position of the clerical staffs under the burden of high cost of living, Mr. Lieb discussed the position of women and of crippled soldiers in industry. Mr. Lieb went in detail into the question of rates and rate increases, saying in part:

In the applications that have been made to public service commissions by member companies for increased rates it has been noted that in many cases they have taken the shape of the addition of a service charge to the normal or a reduced charge for energy.

Where a service charge is introduced into the rate schedule it should not be considered as a temporary war measure, as it implies a fundamental change in the basis of rate making and a modification should be made only with a view to substantial pressure.

Increases, if temporary and made as a war measure, should take the shape of a surcharge, percentage increase or flat addition to the maximum rate or base rate, whatever it may be, so that its elimination at the proper time may not cause a new dislocation of the whole rate structure.

It is gratifying to note an increased responsiveness by regulatory bodies with less insistence when considering application for rate advances on all the forms of procedure usually applied in rate cases and a readiness to use short cuts and common sense approximations in place of the dilatory, expensive and labor-causing processes of appraisal, valuation and other forms of exhaustive investigation considered necessary under normal conditions. It has been found that in general regulatory bodies have been loath to grant increases in the maximum rate but have been more responsive to make increases in the industrial or class rates, increases in the power rates being granted with little hesitation.

Long Spans Facilitate Mountain Service

Steel Cables Are Utilized and the Sag Is Increased Wherever This Is Found to Be Possible—Special Dead-End Construction Is Employed for the Purpose of Withstanding Stress

BY N. B. HINSON

Department of Distribution Southern California Edison Company

INCREASED demands for power at the Carnegie Institute Observatory on Mount Wilson, 16 miles (25.7 km.) from Los Angeles, recently made it necessary either to extend the oil-engine-driven generating plant which has been supplying energy or to purchase central-station energy. Extension of the isolated plant was not looked on with much favor, how-

ever, because the oil has to be hauled up the mountain, which is 5886 ft. (1794 m.) high, over a road 9½ miles (15.3 km.) long. Furthermore, in winter there are times when the roads are impassable, so that oil has to be stored to tide over periods of poor delivery. Providing service from the nearest central station involved difficulties too, but, after studying various routes and making estimates of the cost of construction to see if the line was feasible, it was found preferable to the alternative method considered.

FIG. 1—DEAD-END AT MOUNTAIN TOP

Cross-arms carry busbars; air-break switches on nearby pole are operated from ground; the choke coils connect with underground circuits; at the left are the engine house and motor room.

The nearest power line, which belonged to the Southern California Edison Company and was operated at 15,000 volts, was about 7 miles (11.3 km.) away by air line measurement or 12½ miles (20.1 km.) by road. All but 3 miles (4.8 km.) of the road was over rugged mountains. Some of the canyons are 2000 ft. (609.6 m.) or more deep, and the mountains are heavily wooded in places with pine trees 100 ft. to 150 ft. (30.4 m. to 45.7 m.) tall.

It was impracticable to build a regular pole line along the road; therefore a line was strung as nearly straight as possible between the point of interconnection and the observatory. This involved some long spans across canyons, practically the whole route consisting of seven long spans. The average span is 2071 ft. (631 m.), the longest 3263 ft. (994 m.), that is, measured horizontally between poles, and the greatest difference in elevation is 945 ft. (288 m.) with a horizontal span of 2293

FEATURES OF CONSTRUCTION

To support the lines on these long inclined spans, some of which are also subjected to ice, sleet and snow, special conductors, insulators and supports have to be used. The line conductors consist of 5/16-in. (7.9-mm.) Siemens-Martin extra-galvanized seven-strand steel cable. Tests were made on samples of the cable to determine their elastic limit and maximum strength, which averaged 4800 lb. (2177 kg.) and 7800 lb. (3538 kg.) respectively. The minimum sag employed allows for a stress equal to two-thirds of the elastic limit, a 30-mile (48.3-km.) wind pressure and 2 in. (5.1 cm.) of ice on the three upper spans, but no ice on the other spans. The reason for this is that the two upper spans are on the north side of the first range and the rest of the line is on the south side, which is not subjected to sleet or ice. Wherever the sag could be increased without reducing the ground clearance below an allowable value it was done.

If standard suspension insulators had been used, the

FIG. 2—DEAD-END AT TOP OF FIRST LONG SPAN

mechanical factor of safety would have been very low; for this reason it was decided to use strain insulators in series. Three Westinghouse 6600-volt type PS insulators were therefore connected in series, the insulators in each string being joined with each other and the cross-arms with cable similar to that used in the line.

Two three-bolt clamps were employed in making these connections. The jumpers between dead-end points are supported on pin-type insulators. This construction possesses the advantage that should an insulator break the line will not drop. According to tests made on the strain insulators, the dry flash-over voltage of a single unit is 52,000 volts, the wet flash-over is 14,000, and the maximum strength is 17,760 lb. (8052 kg.).

FIGS. 3 AND 4—DEAD-END CONSTRUCTION FOR 15,000-VOLT LONG SPAN

The line is supported at the end of each span by three 40-ft. (12-m.) poles which have been shaved, treated and painted. They are set 6 ft. (1.82 m.) in the ground, 15 ft. (4.57 m.) apart and are anchored in four directions. On the extra-long spans two anchors are used on each pole, the anchors consisting of reinforced-concrete blocks 12 in. by 18 in. by 26 in. (30.5 cm. by 46 cm. by 66 cm.) with 10-ft. (3-m.) galvanized rods, 1 in. (2.54 cm.) in diameter. The guy-wire material is similar to that used in the line. One strain insulator is placed in each guy.

In order to transport the poles through the winding mountain roads a special rack was built on a truck over the driver's seat so that the poles could be supported on the truck with the tops pointing in

in 5000-ft. (1524-m.) lengths it was not necessary to make any splices in the spans.

The line in the valley is of standard construction, consisting of 300-ft. (91.4-m.) spans and 0.25-in. (0.63-cm.) guy wires for conductors. In the foothills the same type of construction is used, but the spans are longer. The entire line loss is less than 2 per cent. Probably there will never be much increase in load. The line is protected with electrolytic lightning arresters at the lower end and graded shunt-resistance multi-gap lightning arresters at the top. Electrolytic arresters could not be used at the top owing to the great variation in temperature and the very low temperature during the winter months.

The substation at the top of the mountain is built of concrete and is situated in the side of the hill. Fifteen-thousand volt cambric-insulated cable inclosed in con-

FIG. 5—ELECTROLYTIC LIGHTNING ARRESTERS MOUNTED ON ONE POLE

This installation is near the substation at the foot of the mountain. The 15,000-volt lines enter the substation as underground lead-covered cables.

the air over the driver's head. The butts rest on the bed of the truck. This arrangement permitted turning the truck around curves which could not have been negotiated if 40-ft. (12-m.) poles had been transported flat. Five poles were carried at a time. At all points

FIG. 6—APPROXIMATE PROFILE OF LONG-SPAN LINE

duit runs from the overhead line to the transformers. A pole-top switch with fuses and choke coils is provided at this station, while at the lower end of the line is an automatic 15,000-volt oil-break switch. Two motor-generator sets in the observatory substation convert the three-phase, 50-cycle, 200-volt current from the transformers to direct current, which is essential for the work in the observatory. The isolated plant, which includes a storage battery, is still in use and will help to supply energy if any line interruptions should occur. Three-phase local service is furnished to a hotel and

camp near the observatory at 2200 volts from a step-up bank of transformers in the substation.

The line was built by the regular construction crew of the Pasadena district of the Southern California

Edison Company and has been in operation about six months. No trouble of any kind has been experienced, although it has been subjected to two severe wind storms.

Vigorous Fuel-Saving Campaign

Critical Condition of Coal Supply for Next Winter Led to Organized Plans for Economy in Power and Lighting in New England
—Improvement in Boiler-House Practice

NEW ENGLAND faces a critical coal-supply situation next winter, and energetic efforts to forestall a famine are under way with Fuel Administrator James J. Storrow of Boston in the lead. A campaign is on to arouse the industrial plant owner to the vital importance of the economical use of coal. Meetings have been held at Boston, Worcester and elsewhere in the interest of fuel saving, and it has been "put up" to the manufacturers that a total of at least 3,000,000 tons must be saved this year by more efficient plant operation.

WATER SHIPMENTS FAR BEHIND

In a statement which Mr. Storrow issued recently he points out that every economy possible must be practiced since the demands for coal for the calendar year will be greater than they were during 1917 and because water shipments up to the present time are far behind the rate at which they should be coming in if the total amount of coal required (34,000,000 tons) is to be received. Practically two-thirds of this should be delivered by water, but it is doubtful whether this quota can be delivered by boat as all vessels that are available must be used for transporting expeditionary forces overseas. Still the forces at the front must be supplied with food, clothing and munitions. While the railroads have just about met the estimated requirements, it is doubtful whether they can make up any shortage incurred by poor deliveries so far, especially when inclement weather sets in. The situation is made more serious than last year also by the fact that no reserve stocks are on hand as there were at the beginning of the winter of 1917.

In view of the existing conditions, Mr. Storrow has appointed a committee of prominent engineers who will aid the Fuel Administration in carrying out a carefully prepared plan of reducing coal consumption in industrial plants. The committee consists of Dr. Ira N. Hollis, president of the Worcester Polytechnic Institute; Charles T. Main of Boston, president of the American Society of Mechanical Engineers; George P. Gilmore, Fall River; Arthur T. Safford, Lowell; Joseph A. Skinner, Holyoke, and W. G. Starkweather, Boston. Every manufacturer is requested to appoint a permanent factory fuel committee, selected from executives and foremen, and to engage the temporary services of a consulting engineer to advise the committee in the following work: (1) Increasing the efficiency of steam and power generation; (2) equalizing the load on the power plant and reducing to a minimum all friction and idle machine loads; (3) economizing in the use of steam for heating and process work; (4) reducing artificial lighting to a minimum.

Work along the foregoing lines has already been undertaken by several manufacturers with a resulting saving of from 10 to 33 per cent of the coal used. A booklet outlining the fuel-saving plan has been prepared for distribution by the Fuel Administration, and copies have been mailed to manufacturers with pledge cards. The booklet contains four reports showing the actual methods and results of fuel saving in four Massachusetts industrial plants, and it requests that each manufacturer eliminate all waste in the use of both steam and hydroelectric power and advise the Fuel Administration as to his willingness and extent of co-operation.

The economies which different plants have effected have resulted from efforts along many lines, including improvements in methods of heating, changes in the use of steam, modification of process methods, etc., but only such practices as effect the generation of steam, development of power and the utilization of electrical energy will be referred to here.

IMPROVEMENT IN BOILER-HOUSE PRACTICE

The general manager of the Crompton & Knowles Loom Works, Worcester, Mass., reports: "On taking up the matter at the beginning of the winter we felt that it was necessary to have a suitable organization for carrying on our fuel conservation policy, and we therefore appointed from our foremen and executives a so-called shop fuel commission.* A little later we appointed a shop fuel administrator, so to speak, whose business it is to follow up the various methods inaugurated, to see that the best results are accomplished therefrom, and also to see that continued interest is maintained."

Among improvements which have been made in boiler-house practice are the following: (1) Raising temperature of feed water by return of condensation. The temperature of feed water entering the boilers has been raised from 180 deg. Fahr. to 200 deg. Fahr. thereby. (2) The establishment of better boiler-room practice by putting observers in the boiler rooms for several days and nights to determine rate and efficiency of firing. The usage of coal by half-hour periods, as fired, was recorded for many days and plotted, from which was evolved a better practice as to uniform and more economical firing. (3) The weighing of all coal supplied to the boiler room and only allowing a certain amount of same to be used in definite periods. The remainder of the coal was locked up, so that the fireman had to be economical in the use of the portion that was issued to him. (4) Installation of pin-hole grates and under-grate blowers to allow use of screenings. While

*Consists of boiler-room operator, engineer, factory superintendent, assistant superintendent of power and a general inspector.

the screenings have not been very high grade, there have been many days when through the use of these practically no soft coal was used whatsoever. The screenings are being analyzed and the use of all screenings that show an unusual percentage of dirt and ash is being discontinued.

The Atlas Tack Company, Fairhaven, Mass., has covered the tops of its boilers with asbestos cement $2\frac{1}{2}$ in. (6.4 cm.) thick, lowering the outside temperature 10 deg. thereby. In addition, water columns and high-water and low-water alarms have been installed on all boilers to prevent wide fluctuation of water level and assure better economy. On each boiler is also a boiler efficiency meter which shows the firemen at all times the condition of their fires. This has proved a very useful and economical instrument.

A V-notch recording and indicating water meter has been installed to show the boiler-room force the amount of water evaporated per pound of coal. On account of the limited tube area in the feed-water heater formerly used it was impossible to get the best results from exhaust steam, so the tubes have been replaced by a more efficient set, resulting in a 20-deg. increase of temperature. Economizers are also used. The boiler-feed pumps were repaired and put in first-class condition and all engine valves are set for the highest economy. The company is about to install a 5-hp. motor to take the place of a steam engine to run the economizer scrapers.

Hand-stoker grate bars are being installed which, according to the builders' rating, will give about 50 per cent more boiler rating and about 25 per cent saving in coal. An old cooling tower which was inefficient has been abandoned and a spray-pond condensing equipment substituted. The 3-in. to 4-in. (7-cm. to 10-cm.) more vacuum which can be obtained as a result should lower the coal consumption for power alone about 162 gross tons per year. In addition, all boiler settings and brickwork are being examined for necessary repairs and provision is made for scraping the boiler tubes.

It is thought that the increased efficiency which will result from these changes in 1918 will net a saving of at least 20 per cent in fuel.

EXPERIMENTS WITH ASBESTOS COVERING

At the George E. Keith Company, Brockton, Mass., the engineers have experimented to some extent with asbestos covering on the brickwork of the boiler settings. Undoubtedly this covering will be applied to all the boilers. The covering not only cuts down the loss due to heat radiation, but also stops any air leakage. The company was driven to the burning of screenings because it could not obtain soft coal. In fact, it has been doing so in some of the boilers for two or three years with good results. Small forced-draft blowers were installed to get results, as high as 70 per cent of screenings having been burned with soft coal.

Another saving has been effected by piping all condensation returns to the boilers, thus eliminating the expense of make-up water, as a boiler-feed temperature of about 206 deg. is obtained. It has been made a practice to burn all the scraps and waste from the factories, such as paper, shavings, sawdust, etc. Shortly the company intends to build a central plant which will take the place of three isolated plants. In this it will install automatic stokers, weighing devices for re-

cording the amount of coal used, and coal and ash-handling apparatus.

ECONOMY IN THE USE OF POWER

The Crompton & Knowles Company has minimized the waste of power as follows: (1) Under the direction of a shop fuel commission, the number of idle machines on which belts had not been thrown off was observed by an inspector. Vigorous action with the foremen resulted in the number of machines running idle and wasting power being reduced to an absolute minimum. This was accomplished principally by the installation of hooks to permit the handling of idle belts. (2) The studying of the load on every motor throughout the shop. Where the load was not sufficient to get the maximum efficiency from the machine conditions were changed to make this possible. All cases of motors working underloaded were eliminated. (3) All overtime that involved the inefficient operation of machinery was stopped. (4) The use of large elevators was restricted to actual needs. This resulted in the elimination of several hundred trips throughout the day.

CURTAILING UNNECESSARY LIGHTING

The saving in fuel in connection with the use of lights was large and accomplished in three ways, particularly: (1) By the development of interest on the part of the foremen in connection with the actual inspection at various times of the day of lights used. This resulted in the cutting out of a large number of unnecessary lamps. (2) By replacing carbon lamps with tungsten units. The usage of carbon lights had been continued to use up a stock of these on hand, which practice was discontinued. (3) By reducing the wattage of lamps in places where the existing illumination seemed unnecessarily high. This also resulted in a marked saving.

At the Dennison Manufacturing Company, Farmingham, Mass., a reduction in the general illumination around the plant was made. Where under ordinary conditions the general lighting system would be used the amount of light used under the existing conditions was cut down to the minimum and in some places discontinued. Lamps of lower candlepower were substituted in many cases for a larger-sized lamp; this was especially true in stair towers, toilets, bridges, etc. The time when lights were turned on was curtailed. Sign lighting was discontinued, and the street-lighting and factory yard lights were reduced to a minimum consistent with the safety of the plant and the prevention of accidents to employees. The watchmen were instructed to see that unnecessary lamps were not left burning where night work was going on or at any time outside of working hours. All electric and gas-heating applications were turned off from ten to fifteen minutes before closing time. Lamps of less candlepower were used for all indicating lamps and on instruments in the power house.

In order that the peak load due to lights should be eliminated, all passenger service on elevators was discontinued when the lighting load came on, and certain heavy machines, such as the coal carrier in the power house, paper calenders, machinery in the carpenter shop and certain elevators, were shut down at 4 o'clock or thereabouts. As a result the total power and lighting load curve is practically flat throughout the day.

Readjustment and Reconstruction Commission—III

An Account of the Work That Is Being Accomplished in Great Britain by the Ministry of Reconstruction in Preparation for the Great Changes Sure to Come When Peace Is Once More Established

BY WINGROVE BATHON

Washington Representative ELECTRICAL WORLD

PREVIOUS articles in this series have suggested and urged the appointment by the President of the United States of a readjustment and reconstruction commission, to begin to deal now with vital problems in industry which will be presented after the war. It was pointed out that many other countries, notably Great Britain, have already begun to attempt to solve after-the-war problems, and the suggested personnel of a suitable commission, selected from the ranks of American industry, was presented in the first article in this series, the second article dealing in turn with the suggested personnel for a suitable advisory council, taken from the ranks of government officials, to work with such a commission.

WHAT GREAT BRITAIN IS DOING

It was promised that this third article should describe some of the far-reaching work being done along this line by Great Britain, and this is now done as an evidence that it is necessary for American industry to begin now, through a readjustment and reconstruction commission, preferably the President's own commission, responsible only to him, to prepare to solve after-the-war problems. It may be as well to state at the beginning that this description of Great Britain's Ministry of Reconstruction is taken from the official reports to Parliament of the British War Cabinet, furnished to the present writer for the purpose of this article by Arthur Willert, secretary of the British War Mission at Washington. These reports are inclusive of the year 1917 and have just been sent to Washington.

After tracing the earlier stages of the Ministry of Reconstruction in Great Britain, before the ministry was established by the new ministries act, in July, 1917, and when and during the time the agency of reconstruction consisted of a committee of ministers of the crown, the War Cabinet reported that it was found necessary to establish a Ministry of Reconstruction to continue for the duration of the war and for a period of two years or less after its conclusion. It was declared that a Prime Minister, upon whose shoulders fell the responsibility for the conduct of the war, could not personally assume a day-to-day responsibility for guiding the reconstruction committee's work. It was stated that the government had throughout been aware that as the war continued and its pressure upon every side of the national life increased the intensity of the struggle in itself enhanced the importance of the reconstruction problems which had to be faced, and that Parliament and the country were not slow in realizing that there were coming into existence a series of questions of the utmost importance to which answers must be found, not after, but before, the conclusion of the war.

The functions of the Minister of Reconstruction then appointed, and who assumed office in August, 1917, are defined as follows:

"To consider and advise upon the problems which

may arise out of the present war and may have to be dealt with upon its termination, and for the purposes aforesaid to institute and conduct such inquiries, prepare such schemes and make such recommendations as he sees fit, and the Minister of Reconstruction shall, for the purposes aforesaid, have such powers and duties of any government department or authority which have been conferred by or under any statute as his Majesty may by order in council authorize the minister to exercise or perform concurrently with, or in consultation with, the government department or authority concerned."

In other words, as was brought about during the debate which resulted in the creation of the ministry, the minister in charge does not exercise executive functions. He appoints committees, he initiates experiments, he frames schemes for action with a view to conditions after the war; his powers are not exclusive and do not shut out other departments; he assists the other departments, provides them with information and helps them to "build a bridge which will safely carry us over from war to peace conditions." The British Parliament found that the creation of a reconstruction agency was desirable because various government departments are approaching various problems in their own way, each drawing up reports or memoranda, and that what was needed was a co-ordinating element, not especially attached to the work or to the traditions of any one of the departments concerned. The Solicitor General of Great Britain, speaking in debate, declared that what was needed was "a comprehensive co-ordinating mind, a fresh mind, and at the same time an authoritative mind, who will bring together the several contributions of the various specialized departments."

FUNCTIONS OF THE MINISTRY OF RECONSTRUCTION

The Ministry of Reconstruction was then formed. For the purpose of administration the department was divided into branches dealing respectively with commerce and production, including the supply of materials; with finance, shipping and common services; with labor and industrial organization; with rural development; with the machinery of government, central and local, health and education, and with housing and internal transport.

The Minister of Reconstruction then appointed an advisory council, "representative of all the leading interests concerned in reconstruction, and it is his hope by consulting the council freely and regularly to secure a representative consensus of opinion on any proposal which may be referred to him for advice or which may be initiated in the department." This council is organized very much as the Pan-American financial conference held in Washington at the beginning of the war was organized and very much as the old War Industries Board of the Council of National Defense of the United States was organized. In other words, there

are experts in each line named to serve with government representatives. The council is divided into sections, just as the administration of the Ministry of Reconstruction is divided. It is stated that "the membership of the council has been so arranged that in each section all the principal interests represented on the council should find a place; thus there are representatives of labor on the finance section as well as financiers; there are business men as well as agriculturists on the section dealing with agriculture, and so on."

The meetings of the sections of the ministry and the council are private, but it is known that they have already dealt with the standardization of railway equipment, the post-war rationing of industries, the establishment and functions of trade organizations, the organization of rural information centers, the establishment of industrial courts, house planning from the point of view of domestic economy, the future organization of voluntary women's work, and the conditions required for maintaining a supply of efficient agricultural labor.

WORK OF THE DIFFERENT SECTIONS

The section dealing with commerce and production is investigating: (1) the supply and control of raw materials after the war; (2) financial facilities for British commerce and industry after the war; (3) the preservation of industries which will play an essential part in reconstruction but are in extinction through failure of supplies of material or labor; (4) financial risks attached to the holding of trading stocks; (5) trusts and combinations, with special reference to the protection of the consumer; (6) the establishment of new industries after the war, a committee having been especially appointed to consider this question as far as the engineering industries are concerned, a parallel committee considering the labor questions involved; (7) the volume and nature of the demand for British goods after the war, and (8) improvements in trade organization for the purpose of more economical production, distribution and marketing, and expediting the turnover from peace to war.

The section dealing with finance, shipping and common services is, in conjunction with the Treasury, considering the question of currency and exchange after the war, and under this section an advisory council section is at work on the disposal of government stores after the war.

The section dealing with labor and industrial organizations has agreed with the British Board of Trade and the Ministry of Labor that "a concerted effort should be made to promote in as many industries as possible representative organizations to advise the government as to the views and needs of the industries on the various industrial and commercial problems that will affect them during the reconstruction period. The Ministry of Labor is to proceed with the formation of permanent industrial councils. A conference of trade organizations is being established at the Ministry of Reconstruction, consisting of three employers, three trade unionists and representatives of the Board of Trade, the Ministry of Labor and the Ministry of Reconstruction. The Minister of Reconstruction has decided to refer to the industrial section of the advisory council the question of establishing corresponding organizations in engineering and in railways.

This section (dealing with labor and industrial or-

ganizations) is farther along with its work than any of the other sections, apparently, for reports have been submitted on unorganized trades and works, and probably by now on conciliation and arbitration; a general survey of industrial policy as a whole has been prepared, going into the law and labor in merchant shipping, war-time departures from trade-union practices, industrial courts, industrial structures, apprenticeship, the reinstatement of returning soldiers and sailors and international labor legislation. Furthermore, surveys have been undertaken of industrial methods; inquiry is being made into juvenile employment; the question of army demobilization, it has been settled, makes the Ministry of Labor responsible for the returned soldier or sailor, and the Ministry of Reconstruction is to determine the priority of different trades. A complete list of public works which have fallen into arrear has been prepared so that surplus labor may be usefully and rapidly employed, and the Ministry of Munitions has begun work on the special problems arising out of its work.

The section dealing with rural development is examining: (1) the working of the small-holdings act and the future of urban war allotments; (2) a report made by the forestry committee; (3) the rural housing problem; (4) the organization of county offices for advice on agriculture; (5) tithe redemption; (6) village industries, and (7) the report of the land acquisition committee.

The section dealing with machinery of government, health, education, etc., is negotiating through a committee on the distribution of functions in regard to the formation of a ministry of health and is studying reports which have been made (1) on the functions of the poor law authorities and (2) on adult education.

The section dealing with housing and internal transport, with a view to facilitating work in connection with housing, has set to work committees on (1) supply of building materials, (2) house-building construction, and (3) building by-laws. Special investigations are being made by this section on (1) control of public utility societies, (2) town planning, (3) rings in the building trade, (4) the working of the small-dwelling acquisition act, and a general review of the problem of inland transport is being made, the portions dealing with roads and canals having been completed. Furthermore, the ministry is in consultation with the Board of Trade concerning the future of the railways (including light railways) of Great Britain, and an inquiry has been begun into the question of storage and distribution as essential elements in transport policy.

COMMERCE AND PRODUCTION

In the section dealing with commerce and production the report of the British War Cabinet to Parliament states that the question of the "volume and nature of the demand for British goods after the war" and the question of "improvements in trade organization for the purposes of more economical production, distribution and marketing and of facilitating the turnover from peace to war" are being handled in consultation with the British Board of Trade and the Department of Overseas Trade, and that "a comprehensive scheme of work has been prepared." The desire of the government is to leave the industries to ration themselves under certain general principles for which the government must take responsibility.

A Letter Which Explains Itself

Public Utility Companies Are Urged by the Fuel Administration to Store All the Coal Possible if They Would Safeguard Next Winter's Service

UNITED STATES FUEL ADMINISTRATION

WASHINGTON, D. C.

June 1, 1918.

IN YOUR REPLY REFER TO

D-

Mr. William H. Onken, Jr.,
Editor, Electrical World,
New York City, New York.

My dear Sir:

I am sorry that your letter of the 27th ultimo did not get my attention sooner, but I have just returned to the office today for a few hours before leaving for the West.

We find some disposition on the part of public utilities to be rather indifferent in the matter of storing coal because they expect to rely on the Fuel Administration to take care of them throughout the year because of their importance.

As I have already told you, we, here in the Distribution Division of the Fuel Administration, view this disposition on the part of public utilities with distinct concern. If they knew how much difficulty we are having to supply current needs now during the summer time, they would not feel so certain that they would be taken care of next winter. The fact of the matter is, we shall probably find it necessary to insist that many public utilities store coal during the summer and we will make the coal available for that storage. This is the only way in which we can feel certain that we can put them through the winter without serious danger of shut downs.

I am sorry that I have not time to get you up an article on this line, but the foregoing is a brief expression of our sentiments in the matter.

Sincerely very truly,

UNITED STATES FUEL ADMINISTRATION

By

General Director, Distribution

JDAM-LH

Steel Conductors for Series Circuits

Facts That Determine Choice Between Steel and Copper—A Practical Formula and Its Application to a Particular Case—Most Economical Size of Wire to Use—Other Considerations

BY L. M. KLAUBER

Superintendent Electric Department San Diego Consolidated Gas & Electric Company

ALTHOUGH the use of steel conductors in transmission and distribution circuits has advanced considerably as a result of recent material markets, many companies still hesitate to use the cheaper metal because early experiments in some cases proved failures. Such failures have been both mechanical and electrical. Mechanical failures have occurred owing to rapid corrosion of the conductor or to annealing following short circuits. Most of these cases, however, have been found upon investigation to have involved the use of solid conductors of comparatively small size, such as No. 6 or No. 8 B.W.G., attempts having been made to use conductors similar in mechanical form to the copper superseded. Extra-galvanized stranded steel, on the other hand, has long been extensively used for guys, and its life as a conductor may therefore be closely estimated by any central station, the estimate being based on the performance of guys in the same regions.

Electrical failures have been due to insufficient data on the electrical characteristics of steel conductors, and particularly to lack of consideration of the skin effect in solid conductors, which results in excessive drop at higher current densities. But extensive data on this subject have recently appeared, especially covering the stranded steel largely used in guys, so that the principal uncertainty which now remains has to do with the characteristics of the load, both present and prospective. Obviously, savings through the use of steel result primarily from the fact that in certain classes of lines copper of greater cross-section than is electrically necessary must be used for mechanical reasons. For this reason, an economical steel substitute will have less capacity for increased load than the copper replaced. It is therefore essential in designing steel lines that regulation and losses be closely calculated and that suitable allowances be made for future load increases.

One case in which most of the factors and results may be closely calculated in advance has to do with the use of steel conductors in series street-lighting circuits. In this case current and hours of use are fixed so that losses may be predetermined exactly. Since increased load involves increased pressure per circuit or increase in number of circuits, there is not the possibility of having to replace steel with copper upon acquisition of unexpected new business. Furthermore, there is no possibility of deterioration of the line by annealing during short circuits. If stranded steel guy cable is used, the life may be gaged from previous performances.

FORMULA FOR CHOICE OF CONDUCTOR MATERIAL

It is obvious that the economical choice between steel and copper will depend on a number of factors which are different for each individual case. Of fundamental importance are the costs of the two materials, rates of interest and depreciation and the cost of energy. In general, it may be said that steel will be the cheaper

when the annual fixed charges on a copper line are greater than the fixed charges on the steel line plus the increased energy losses by reason of the use of steel plus the fixed charges on the additional constant-current substation apparatus required because of the greater losses in the steel as compared with copper. Stating this in the form of an equation:

$$F_c C_c - F_s C_s - L(HW + F_c C_c) = X.$$

It will be more economical to use steel when X is positive; when X is negative copper is preferable.

In the preceding equation F_c , F_s and F_c represent respectively the rates of interest plus depreciation on copper lines, steel lines and substation equipment. C_c and C_s represent the first cost of unit lengths of copper

FIG. 1—COMPARATIVE LAYOUTS USING STEEL AND COPPER

and steel lines. This cost must be the cost in place, including overhead expense, since when lines must be removed the total cost in place must be retired from service. C_c represents the first cost of series lighting transformers per kilowatt. L equals the excess loss in kilowatts in a unit length of steel over copper. This quantity evidently depends on the current in the series circuit and the relative resistances of the two conductors at this particular current density, it being remembered that the alternating current resistance of the steel varies with the current density. H represents the annual hours burning in the street-lighting system under consideration. W is the cost of energy per kilowatt-hour delivered at the substation buses; this item should, however, include only those elements of production cost which vary with output (*i.e.*, fuel cost in steam plants).

Were the relative prices of steel and copper to remain in constant ratio with markets fluctuating proportionately, either the one metal or the other would be invariably preferred for certain circuits. This, however, has not been the case, especially under recent ab-

normal conditions, as shown by Fig. 2, which gives the relative costs of steel and copper deduced from the purchasing department records of one central station for the last eight years. It may be seen that the cost of copper wire has varied from about twice to nearly five times the value of steel wire. Under such changing conditions it is logical that sometimes one and sometimes the other metal is more economical.

APPLICATION OF FORMULA TO A PARTICULAR CASE

In order to illustrate the application of the above formula, two cases are assumed, one comparing bare copper with bare steel, the other double-braid weatherproof copper with weatherproof steel. The prices assumed should not be considered as indicative of present costs, since they are rather those which applied some months ago:

In giving values to F_c , F_s and F_e interest is taken at 6 per cent. Bare copper is assumed to have a life of thirty years and a junk value of 40 per cent. (In each

FIG. 2.—FLUCTUATIONS IN RATIO BETWEEN COPPER AND STEEL COSTS DURING NINE YEARS

case the junk value represents the sale price as junk less cost of removal.) Weatherproof copper is presumed to have a twenty-year life and a 30 per cent junk value, since the serviceable life of an insulated conductor is in reality the life of the covering; for, regardless of the life of the metal, it must be removed when the covering becomes abraded. For this service weatherproof steel may be assigned the same life as copper, although the junk value will be zero. Bare double-galvanized steel under normal conditions (away from salt fogs or corrosive fumes) is assumed to have a life of fifteen years and to be without net salvage value. Constant-current transformers are assigned a life of thirty years and a salvage value of 10 per cent. Basing depreciation calculations on the straight-line method and adding interest at 6 per cent, the following conditions exist:

	Weatherproof	Bare
F_c	0.095	0.080
F_s	0.110	0.1267
F_e	0.090	0.090

Practically all series lines are No. 6 copper, so only this size will be considered. The best steel substitute appears to be $\frac{1}{4}$ -in. (0.63 cm.) extra-galvanized standard steel strand. Assuming copper (weatherproof or bare) at 34 cents per pound (75 cents per kilogram) at the storeroom, bare steel at 8 cents (17.6 cents) and weatherproof steel at 11 cents (24.2 cents), adding 4 cents per pound (8.8 cents per kilogram) as the cost* of stringing and 15 per cent overhead, and considering 1000 ft. (304.8 m.) as the unit of length throughout, with bare copper weighing 79.5 lb. per 1000 ft. (118 kg. per km.), double-braid weatherproof copper 100 lb. (149 kg. per km.), bare steel 125 lb. (185 kg. per

km.) and weatherproof steel 155 lb. (230 kg. per km.), the following is true:

	Weatherproof	Bare
C_c	\$43.70	\$34.74
C_s	26.74	17.25

(C_e is assumed to be \$12.50.)

In the determination of L the resistance of copper is taken as 0.395 ohm. Within the comparatively small range of commercial alternating-current series circuits (4 amp. to $7\frac{1}{2}$ amp.) there is little change in the resistance of $\frac{1}{4}$ -in. (0.63-cm.) galvanized steel, the total increase at the higher density being about 3 per cent above the lower. This is less of a variation than that found between individual samples and may therefore be neglected. The 60-cycle alternating-current resistance of $\frac{1}{4}$ -in. (0.63-cm.) extra-galvanized seven-strand standard steel at these densities has been found by various investigators to be from 1.62 ohms to 1.78 ohms per 1000 ft. (5.3 ohms. to 5.8 ohms, per km.). Taking 1.70 as an average, and assuming a 6.6-amp. series circuit, $L = 0.0568$, H may be taken as 4000 for all-night lighting circuits, 2600 for moonlight and 2200 for midnight circuits. W obviously differs for each individual case and is here taken at \$0.005.

Substituting the preceding values in the equation, the following values of X are obtained:

Circuit	Weatherproof	Bare
All-night	0.01	— 0.61
Moonlight	0.41	— 0.21
Midnight	0.52	— 0.10

Thus in each assumed case it will be found more economical to use weatherproof steel rather than weatherproof copper, but bare copper (if line and ordinance conditions permit the use of uncovered conductors) is to be preferred to bare steel.

Assuming the same constants but a 4-amp. circuit, $L = 0.0209$; therefore it will pay to use steel in every instance.

MOST ECONOMICAL SIZE OF WIRE TO USE

Of the various sizes of standard steel strand, $\frac{1}{4}$ -in. (0.63 cm.) will usually be found preferable for series circuits. Smaller sizes lack strength and are not so readily obtainable as the sizes used for guys. Although largely used in multiple circuits where steel is employed, $\frac{5}{16}$ -in. (7.9-mm.) cable will generally be less economical than $\frac{1}{4}$ in. in series circuits. This can be shown as follows: Consider $\frac{5}{16}$ -in. bare steel weighing 210 lb. per 1000 (312 kg. per km.) and double-braid weatherproof weighing 255 lb. (378 kg. per km.). By substituting the same unit prices and depreciation rates as were assumed in the case of $\frac{1}{4}$ -in. cable, omitting fixed charges on substation equipment, as they are of minor importance, and assuming that the alternating-current resistance of $\frac{5}{16}$ in. (7.9-mm.) standard strand is 1.25 ohms per 1000 ft. (4.1 ohms per km.) at the current densities under consideration, the original equation reduces to:

$$1.486 - 0.45I^2HW = X \text{ for bare}$$

$$\text{and } 1.898 - 0.45I^2HW = X \text{ for weatherproof.}$$

Thus for 6.6-amp. series circuits it will be more economical to use $\frac{5}{16}$ -in. (7.9-mm.) strand than $\frac{1}{4}$ -in. (0.63 cm.) cable only when the cost of energy per kilowatt-hour at the substation exceeds the following:

	Weatherproof	Bare
All-night	\$0.024	\$0.019
Moonlight	0.037	0.029
Midnight	0.044	0.035

*There is practically no difference in the cost of erecting copper and steel.

It may therefore be seen that $\frac{1}{4}$ -in. strand is to be preferred in all ordinary cases.

OTHER CONSIDERATIONS THAT AFFECT CHOICE

Of course, in a problem of this nature, involving a choice between copper and steel, or between two sizes of steel, the mere balancing of reduced fixed charges against increased operating expenses is not always the sole controlling factor. Where work is of a temporary character, as for camp or protective lighting, the element of depreciation which operates so strongly in favor of copper is more nearly equal for the two metals, and steel is usually to be preferred. Again, there are occasions when difficulty in raising funds renders desirable a reduced cost of installation, even at the expense of slightly increased operating expenses over a term of years.

There are other cases in which considerable savings may be made in first cost, owing to the increased tensile strength of the steel permitting wider pole spac-

ings. An example of such a case is shown in Fig. 1. It is assumed that blocks are 300 ft. by 600 ft. (91 m. by 183 m.), with 80-ft. (24-m.) streets, and that commercial lighting feeders and mains are run in the alleys. The most economical system of covering the territory with steel takes only about 62 per cent as much line as the copper method shown. Besides, the construction is much simplified at corners and many dead ends and anchors are eliminated. The route outlined for the steel circuit is impossible with copper unless extra poles be added as indicated. This would considerably increase the cost and would be undesirable from a public-policy viewpoint, as it is preferable to have poles only on street corners where they carry street lamps.

On the other hand, with steel conductors it is perfectly feasible and safe to jump 380 ft. (116 m.) from alley to alley in the blocks where street lamps are missing, thus permitting the simplified system of passing back and forth on cross streets.

Stock Worth \$8,203,000 Sold Locally

Pacific Gas & Electric Company's Plan Interested More than 40 per Cent of Employees, and by Means of It 6663 New Stockholders Were Added to the Number Already on the Books of the Public Utility

WITH the increasing difficulty in raising money by public utilities, the plan of selling securities locally is appealing more than ever to utility operators. Generally speaking, money is cheaper and easier in local markets than in the large financial centers. Not many electric utilities have made an effort to place their securities locally. One of the pioneers in this line of activity is the Pacific Gas & Electric Company of San Francisco.

In June, 1914, this company undertook to market an issue of \$12,500,000 of first preferred 6 per cent stock. The method of doing this was so successful that by the close of 1915 not only had the entire issue been sold but permission was obtained for issuing an additional \$2,500,000 as might be needed, thus bringing the total issue up to \$15,000,000. Up to the early part of 1917 \$14,553,000 had been sold, without any underwriting, out of the total issue, of which more than 50 per cent had been sold to employees, consumers and others living in territory served.

The greatest attention to the stock-selling campaign was given in the latter part of 1914. Concentration on sales work was less in 1915 and 1916, and during the past year no sales effort whatever has been put forward. However, subscriptions are now coming in constantly without solicitation. In recent months these have been totaling \$25,000 to \$30,000 per month. The company believes that it is good policy to sell stock to consumers, and even though no sales effort is being made, stock will always be kept on hand to meet unsolicited applications.

The tables show how the sales were distributed over the two and one-half years of activity. The sales by months in 1917 reflect the high degree of prosperity that manifested itself in January and how the investment in stocks suddenly dropped off after our

entry into the European war. It will be noted in the table summarizing stock sales for the four years that the average investment of each purchaser is \$1,231. The total of 6663 purchasers includes about 1750 employees, or 40 per cent of the total number, and includes very few people not served by the company either directly or indirectly.

Since this stock-selling plan was inaugurated the par value of the outstanding stock has increased 40 per cent and the number of stockholders 177 per cent, which is considered a striking illustration of what can be accomplished by distributing the stock in small amounts among a large number of investors.

In describing the methods followed in selling this stock to consumers and employees, A. F. Hockenbeamer, vice-president and treasurer of the company, who originated the plan, has the following to say:

Under date of June 1, 1914, we issued a circular to all officers and employees of the company. Distribution was effected through our local offices, and these offices also handled the subscriptions. On July 24 we issued a circular to all of our consumers. About 260,000 were mailed in sealed envelopes as first-class matter. The circulars inclosed in envelopes were sent to the local offices where the addresses were placed upon them by means of the addressograph machines used in making out gas and electric bills.

On Aug. 15, 1914, we sent a second circular to practically all consumers, but this time the distribution was effected in each district by means of collectors who delivered the circulars as they covered their routes in the performance of their ordinary duties. In some cases special messengers were employed. With this circular we inclosed a return post card giving the consumer an opportunity to indicate whether or not he had sufficient interest in the offering to justify our sending some one to see him or to send him further information. Very few of the post cards were returned, and this part of the plan was a failure.

Just before mailing the circular to officers and employees we had a meeting in San Francisco attended by all heads

of departments, district managers and all principal employees. At this meeting full information was given and everybody present encouraged to ask questions. A similar meeting was held at the time the first circular to consumers was mailed.

Advertisements, which were changed from time to time, were inserted in the principal San Francisco papers and in practically all of our country papers. In this connection a good deal of excellent publicity was obtained in the news columns of these papers. This latter publicity was along legitimate lines as the plan was a novel one and naturally created a good deal of interest. Our managers and a good many of our employees solicited subscriptions. In addition to these we sent out a few men from the head office, not over five or six at any one time, who worked on a commission basis of \$1 per share.

In some of the smaller communities, and in several cities outside of our territory where we had no managers of our own, we made arrangements with local men, usually real estate and insurance brokers, to secure subscriptions on the basis of paying them \$1 per share. These local men were supplied with printed cards to place in their windows and on their counters, and we also used similar cards in our own offices.

We established at the head office a "stock sales department" where the details of the campaign were handled. This department prepared and sent out all circulars and advertisements, handled local agencies, the outside solicitors referred to in the foregoing, and took care of correspondence. At first a commission of \$1 per share was paid regular brokers, but the results were rather meager, as the stock was not as a rule bought by brokers' clients, and after a few months this commission was withdrawn.

On the back of the first circular to consumers appeared a list of 93 banks, these being the depositaries of the company in the cities and towns in which it operates, which, by special arrangement, act as agents for receiving subscriptions and payments. This proved to be a convenience to subscribers and also resulted in a number of subscriptions being received through the direct efforts of the banks. The most efficient service was rendered by depositaries in San Francisco.

As a rule the country banker was actuated more by the desire to keep his deposits intact than by any wish

Newspaper advertising, personal work of local managers and employees and circulars to consumers were the most effective means of making sales. Local agents and outside solicitors accomplished comparatively little. One of the interesting features of the campaign was that most of the stock was bought, apparently, by those unaccustomed to investing in securities. Evi-

TABLE II—SALES OF FIRST PREFERRED STOCK TO EMPLOYEES, CONSUMERS AND OTHERS IN TERRITORY SERVED BY THE COMPANY

	No. of Sales	Par Value Stock Sold
*1914.....	3684	\$2,405,200
1915.....	1712	3,785,100
1916.....	617	1,123,100
1917.....	650	890,000
Total.....	6663	\$8,203,400

*First sales were made in June, 1914.

dences of this were the large percentage of payments made in coin which had evidently been hoarded away.

Mr. Hockenbeamer's conclusions are that at least three conditions must obtain to insure success for a stock-selling campaign of this sort—first, the security offered must be safe and sound beyond question, as it would be suicidal to have anything go wrong with the investment after being widely distributed among customers; second—denominations must be sufficiently small to be within the reach of people of moderate means; third—the yield on the investment must be relatively high, for example, approximately what a good real estate mortgage should return.

Increased Utilities Costs in Oklahoma

The answers to a questionnaire on increased utilities costs sent out to Oklahoma properties show considerable advances in labor, fuel and other materials. The advances in percentages as referred to costs in 1915 were given in a paper read before the convention of the Oklahoma Gas, Electric and Street Railway Association of Oklahoma by Prof. L. W. W. Morrow, director of the School of Electrical Engineering, University of Oklahoma.

Increased labor cost:

	Low	High	Average
Linemen	15	75	50
Engineers	—	70	40
Common labor	20	100	60
Mechanics	17	100	45
Firemen	21	100	51
Office force	—	100	33

Increased fuel cost:

	Low	High	Average
Coal	20	40	25
Oil	100	300	200
Gas	—	100	20

Increased cost of other materials:

	Average
Meters	25
Wire	90
Hardware	70
Lubricating oil	50
Waste	100
Water-treating material	50
Pipe	100

The report shows an increase in operating income, but in every case an increase of operating ratio was reported. Taxation expenses were reported as increased from 3 to 25 per cent.

TABLE I—FIRST PREFERRED STOCK SALES BY MONTHS

	1915		1916		1917	
	Number of Sales	Par Value Stock Sold	Number of Sales	Par Value Stock Sold	Number of Sales	Par Value Stock Sold

to help secure subscriptions. Having this long list of banks on the back of the circular, however, lent distinction to the offering and undoubtedly helped to impress a good many people. With one exception, no compensation was paid to the banks for their services, although they were to be allowed one-tenth of 1 per cent on all payments handled. The money was to remain with them on deposit until needed by the company. Most of the money is still in the country banks.

War Service of the Electrical Manufacturers

How the General War Service Committee of the Electrical Manufacturing Industry Has Worked with the Government to Promote the Nation's Interests and Bring Victory Nearer

BY ROBERT K. SHEPPARD

In presenting the report of the general war service committee of the electrical manufacturing industry, of which he is chairman and C. L. Collens II, James C. Hobart, J. R. McKee, William W. Nichols and Charles A. Terry are the other members, to the Hot Springs (Va.) convention of the Electric Power Club, held on May 30 to June 1, Mr. Sheppard spoke in part as follows.

THE organization of the electrical manufacturing industry was begun Nov. 28 last at the first meeting of the general war service committee appointed concurrently by you, the Electrical Manufacturers' Club and the Associated Manufacturers of Electrical Supplies, under resolutions suggested by the Electrical Manufacturers' Council and according to plans formulated in September, 1917, at the war convention of American business under the auspices of the Chamber of Commerce of the United States. Our nation has the right to call for, and her industries have the duty to give her, every unit of energy which will propel her enormous war machine most quickly and effectively against her foes. Devoted men, without hope of other reward than a consciousness of loyal service rendered to their fellow-men, have thrust aside their great interests in civil life to put all their wisdom, all their experience, all their organizing powers at the government's service. You find them in the War Industries Board and its divisions and sections, in the Food and Fuel Administrations; you find them in army and navy uniforms, in the Red Cross, in the Y. M. C. A.; you meet them everywhere. They are doing glorious deeds silently and with infinite patience; they are bearing unknowing, unkind, unfair criticism as silently and stoically. Many of them have tasks for the adequate fulfilment of which they should have ready to their hand the knowledge, the resources, the sympathy of an army of specialists, men in every industry who have learned their particular business from the ground up. We owe them our aid.

ORGANIZED INDUSTRY ANSWERS COUNTRY'S CALL

Organized industry, voluntarily preparing itself for every emergency, enlisting itself in unselfish co-operation, summoning every American manufacturer to service, that is the answer already given to the bugle call for intensive industrial mobilization. The electrical manufacturing industry is one of nearly 150 lines of business to begin that united industrial service. That is why your general war service committee was appointed. Its aim is to gear together the hundreds of big and little wheels known as electrical manufacturers, to get all the wheels into the mechanism, to keep them there and in running order so long as there is any possibility of this particular mechanism being a help to our country in winning the war. That truly is more than one job; it is a combination of big undertakings consuming much time and much labor.

There are a multitude of electrical manufacturers who

are not members of either the Electric Power Club or the Associated Manufacturers of Electrical Supplies. The allegiance of that multitude is essential to the fulfilment of your war service committee's duty. Many of those manufacturers have already responded splendidly.

The splendid work which you had done in connecting your branch of our industry with the federal government rendered material assistance to our efforts further to organize the industry. The remarkable service of the wire and cable manufacturers, under the able leadership of Le Roy Clark, gave the federal authorities such a marked example of efficient collective service that equal service in case of shortage of supply would be heartily welcomed at Washington. Under the plan of your committee to organize the rest of the industry into similar groups, such service could be had from any section of the electrical industry.

TWENTY-SIX GROUPS ALREADY FORMED

Already twenty-six such groups have been formed, and several more are in process of organization. Each group has chosen its own committee through which to give its collective service in its special line of manufacture. Groups of manufacturers who hitherto have not found homes in any electrical association, voluntarily applying for places in the organization, have proved to the general committee their eligibility for war service as electrical manufacturers. The groups find their places naturally in two great divisions of the industry, the manufacturers of electrical apparatus and the manufacturers of electrical supplies. In those great divisions staff committees have been organized. They are the connecting links between the general war service committee and the groups. They also serve the dual purpose of co-ordinating the work of the group committees and providing responsible bodies for the discussion of the problems of each large division of the industry in relation to the war needs of the nation.

The wisdom of so organizing the industry has been conclusively demonstrated. Few changes in this form of organization will occur, but its expansion may yet be considerable. This war service organization really amounts to an economic movement, begun under the heavy pressure of an unprecedented need, but destined to benefit our entire industry long after the present demand for its peculiar service has been stilled by the final victory of the Allies.

So useful to the government have been the devotion and unselfish labors of the chairman of the wire and cable committee, whom we mentioned once before in this report, that the recently organized War Industries Board summoned Mr. Clark to be the chief of its newly-created Wire and Cable Section.

Your general committee has consistently urged the war service executive committee of the Chamber of Commerce of the United States to persuade the federal

government to stop the numerous questionnaires which at one time were being sent out from many different bureaus in Washington. Our appeal has met with some success. The War Industries Board has now a central bureau for the collection of statistics.

In the preparation of bulletins your committee sympathizes with the feelings of many executives who are flooded with bulletins on every conceivable subject. Nevertheless, it has seemed best to your entire committee in the last six months to issue six bulletins, making them as concise as possible.

Your committee has considered carefully whether or not it ought to supply the industry with a Washington office, competently manned, for war service. We have consulted many manufacturers who are not now represented there. Group chairmen also have expressed their views. The opinions of them all favor the committee's present plan of administration without a Washington office. Furthermore, this plan is approved by important leaders in war service who are themselves now stationed in Washington, such as the chairman of the war service executive committee of the Chamber of Commerce of the United States. The large cost of having headquarters in Washington would be a waste of financial resources unless and until that agency could be made the repository and disseminating medium for much varied data that have never been possessed by any small group of men in our great industry. For these and other reasons your committee will continue its offices for the present at 50 Church Street, New York City, and put forth its best efforts to strengthen and utilize the services of the group committees.

Much detail of organization had to be completed before the committee could proceed with its most important service to the industry in its relation to government requirements, namely, the compilation of a directory of electrical manufacturers and their products. That directory is now almost ready for publication. In the first part of the book all electrical products are cataloged by classes. To each group was assigned the task of choosing its own classification of the articles in its line and of listing all American manufacturers of those goods as completely as they are known, and provision has been made to add to the list as other makers become known to us. Against each cataloged item are given reference numbers which identify in Part II the manufacturers who make the article. On the same pages with the lists of manufacturers are given the committees appointed by those manufacturers to deal with all government agencies requiring collective service from the groups.

The simplicity and completeness of the scheme is the greatest assurance that it will be used in government departments by the men directly charged with engineering, procurement, inspection and like duties. The directory will enable those men to get quick, direct contact with individual manufacturers, or with all of them, or with the responsible committee who will speak and act for the group collectively.

Compiling the data for the directory has been a big task which could not have been done without the devoted work of the chairmen of group committees, the untiring efforts of W. H. Lanman of New York City and the splendid co-operation which has been freely given in all quarters wherever we have turned for aid.

Applied to an entire industry war service comprises

many varied activities. None can speak more vividly of the imperative and unexpected calls from government quarters than can the members of some of our committees. At the least reckoning, our industry's pledge to war service means:

1. That every facility, including plants that never did government work before, shall be used to maintain maximum production of materials essential to winning the war.

2. To supply the needed articles in the quantity, of the quality required and in the time set.

3. To supply them at moderate prices.

4. To provide engineering data, advice and similar help which the experts of industries are best qualified to supply.

5. To suggest changes or temporary abatements in specifications if pre war standards prevent delivery on time of an adequate supply of the needed articles.

6. To produce essentials at the sacrifice of non-essentials.

7. To remedy existing shortages and prevent impending ones.

8. To aid the authorities in wisely distributing and conserving raw materials, fuel, power and those supplies which have to be imported and are necessarily restricted by shortage of ships.

9. To arrange with the proper authorities so that labor available in our industry may be so distributed as to be most productive.

10. To accept and provide for dilution of labor.

11. To work with those committees of the government which determine priority of production, of fuel distribution and of transportation, to the end that the stream of essential goods may not be impeded.

These and many unforeseen tasks will make up the programs for our committees in the coming months.

The needs for war production of any section of our industry are known best to the men who are actively engaged in it. They know the products, the manufacturing capacities for war service, the available engineering talent, the costs of the goods and numberless details. Those men are on our group committees, and your general war service committee purposes to do all that it can to bring those group committees close to the powers in Washington.

A NEW master has conquered the world, and with weapons so strong and cleaving that he brings every art and industry to harvests not to be imagined a century ago . . . From long before the dawn of history the flame kindler was the commander of human toil, and for ages every stride in civilization but confirmed his supremacy. Yet during the past sixty years that supremacy has ended for good and all, and we see that the flame user but paved the way for bolder feats and deeper insights than were to him possible. Electricity to-day does all that fire ever did, does it better, and then accomplishes tasks infinitely beyond the scope of fire, however skillfully applied.—George Iles.

Development of Electric Searchlamps

The Newest Principle of Operation Consists of Rotating Small-Diameter Cored Electrodes Subject to Increased Arc Voltage in Order to Give a Highly Concentrated and Intense Crater

BY LOUIS J. AUERBACHER

ONE of the first uses made of the electric arc light discovered by Davy in 1802 was its application as the luminous source of searchlamps. For such apparatus particularly the discovery of the electric arc signified an enormous step forward. Not only a source of high luminosity was required here, but also, and even more, a high specific intrinsic brilliancy. Therefore the luminous source had to be restricted as much as possible, in spite of its high luminosity, to a minimum surface. This requirement was best met by the arc, whose main source of illumination is the crater.

In the course of the development the arrangement of this luminous source was subjected to many changes. In the first and earliest searchlights the carbons were arranged one above the other, vertical to the optical axis of the reflector or lens. Subsequently they were arranged obliquely to the optical axis, in order to obtain a better radiation of the light from the positive crater. Then the system was adopted of placing the carbons in line with the reflector axis. In this manner probably the most symmetrical radiation of the light upon the reflector is secured. At times the negative carbon in this system was placed at a right angle to the positive carbon, or at an acute or obtuse angle. By this means it was desired to avoid as far as possible the formation of shadows by the negative carbon. It was difficult, with the horizontal lamp, to maintain the crater constantly in a uniform, rectangular position to the optical axis. Consequently directive magnets were employed or the positive carbon was made to rotate slowly

it was soon recognized that the frequent disturbances were mostly caused by the negative carbon. Various attempts were made to remedy this condition. First of all, it was found advantageous to use a negative carbon of an essentially smaller diameter than that of the positive electrode. In this connection reference should be made to the German imperial patent No. 185,216 (1906), Gebr. Siemens & Company, Charlottenburg. According to this patent, a thin carbon rod is surrounded at a certain distance from its burning end by a tube in such a manner that the rod can be easily moved or rotated therein. The tube serves to decrease the resistance in the electrode, besides serving to protect the thin carbon rod from combustion. This arrangement of the electrode is said to give very favorable results, as the thin carbon rod always burns away in the form of a slender point. From this slender point the arc is thrown out in the form of a rather thin ray in the direction of the axis of the rod, its position being stationary. Therefore the crater of the positive carbon is very uniform and the light, it is claimed, is steadier. Furthermore, the slender electrode point does not impede the radiation from the positive crater to any great extent.

The scheme outlined requires the use of comparatively long negative carbon rods which cannot always be arranged conveniently in the space between the reflector and the luminous source. According to the German imperial patent No. 203,549 (1908), Gebr. Siemens & Company, therefore, the thin negative carbon takes the form of a bent rod and likewise, at the front end, is conducted through a protective tube, which

FIGS. 1, 2 AND 3—COMPARISON OF CANDLEPOWER CURVES, AND ILLUMINATION PRODUCED AT 6800 FT. AND 27,550 FT. BY BECK LAMP

Curves A and B refer to the Beck lamp, while C and D refer to old-type searchlamps. The readings for curves A and C were

or rapidly around its axis. Arrangements are also employed in which the carbons, especially the positive carbon, can be adjusted to the proper position while burning without opening the searchlight casing in order to bring the crater into the right position.

When, in the course of time, constantly higher currents were used and the requirements became more and more stringent in regard to the steadiness of the light,

taken in one plane and those for B and D in a plane at right angles thereto.

prevents the combustion of the rod and decreases its resistance. This protective tube may be provided at the end nearest the arc with a protective cap of refractory material. According to this patent, the electrode holder through which the carbon is conducted is cooled from its interior by the application of liquids or gases (air or any other gas desired).

The idea of using as thin negative electrodes as pos-

sible for the same purposes is also found in the German imperial patent No. 255,314 (1910) of Heinrich Beck. However, in this patent the disadvantages of the heavy protective tube which produces disturbing shadows and is very susceptible to destructibility are eliminated. According to this patent, gases or vapors are directed to the burning end of the thin negative carbon, thus impeding the quick combustion of the negative carbon. As the gases employed are usually good conductors of heat, the desirable cooling-off of this electrode is obtained. This enveloping by gas constitutes a sort of economizer, which, however, is transparent and consequently does not impede the radiation of light from the positive crater against the reflector.

It was found advantageous to permit the point proper of the negative carbon to protrude through the gas envelope. The negative electrode is provided with a core composed of material more refractory than the carbon shell, to assure a slender burning end and thus minimize the formation of shadows by the negative electrode.

Another development in which it was also the object to use thin negative carbons is embodied in the German imperial patent No. 210,251, Gebr. Siemens & Company. The negative carbon is provided with a metal coat which melts off before it arrives in the neighborhood of the arc.

While all the patents referred to deal with the improvement of the negative electrode of the ordinary arc, we find in the German imperial patent 215,177 (1908), Gebr. Siemens & Company, an arrangement aiming at the improvement of the positive electrode in the ordi-

is minimized by making the diameter of the positive electrode as small as possible. Thus the crater which remains smaller than the carbon exposes relatively less surface than in other arcs and radiates less heat, it is said. In order to protect the carbon rod against premature destruction, it is incased in a protective tube, as described in patent No. 185,216.

Summarizing all the arrangements described, from

the first application of the Davy arc to the latest and most perfected models, it may be noted that after the initial application practically no change was made in the fundamental principle of the generation of light. The quality of the carbons was constantly improved upon, but it can hardly be said that any essential improvement was made in the specific brilliancy which was obtained in the first searchlight-lamp

FIG. 5—MECHANISM AND ELECTRODE HOLDERS OF SPERRY LAMP

FIG. 4—ELECTRODE HOLDERS AND OPERATING MECHANISM OF BECK LAMP

nary pure-carbon arc. In this arc the positive electrode, as is well known, tapers toward the crater and the entire end of the electrode is at a high degree of incandescence. The highly incandescent conical carbon end, which is mainly heated indirectly by means of the transformation of energy in the crater, radiates a part of the added (conducted) electric energy into heat and therefore decreases the efficiency of the arc. This loss

models. The chief progress has been in increasing the current per lamp and in obtaining at the same time a steady light from the crater. Increase of the current alone, which also has its limit, failed to produce any more luminous searchlights, as the specific brilliancy is not materially affected thereby. In order to obtain a higher luminosity, larger reflectors have to be used, but there is a practical limit to their dimensions.

Thus a temporary condition was changed when Heinrich Beck of Meiningen succeeded by the use of a cored carbon for the positive electrode in producing a novel arc which had hitherto been entirely unknown. In this arc the specific brilliancy of the crater has been increased to such an extent that it is possible to construct searchlight lamps which excel their predecessors in luminosity by 300 per cent and more.

The use of impregnated carbons for searchlights was described before Beck's development in the German imperial patent No. 136,095 (1901), Hugo Bremer, where its disadvantages were also outlined. The light emanates chiefly from the voluminous flame which is produced with such carbons. The total luminosity is great, to be sure, but the specific brilliancy which is the essential thing is not high, since the luminous surface is too large. To avoid this objection Bremer tried to compress the arc mechanically by means of an air current, but it is doubtful whether he was successful.

Beck found that a novel arc is obtained if the positive carbon containing luminous substances is made very thin and required to carry a large current. The diameter of the carbon is smaller than the crater of the pure carbon arc. The arc thus obtained is characterized

by the deep funnel-shape crater, which is filled with luminous vapors of very high specific brilliancy; by positive and negative flames, which are both visible; by the relatively small illuminating power of the flame between the electrodes compared with the luminosity of the crater, and by the high arc voltage, which is approximately 73 volts.

In the United States patent No. 1,086,311 and the German imperial patent No. 274,110 (1912), Beck says

FIG. 6—RELATIVE DIAMETERS OF STANDARD AND BECK ELECTRODES FOR SAME CURRENT RATING (150 AMP.)

that by the use of highly loaded flame-arc carbons two arc conditions are possible for the same current and separation of the electrodes. In the one condition the crater is flat and the voltage amounts to about 43 volts. In the other condition, with the same separation of electrodes, the voltage is about 73 volts and the crater assumes a very deep funnel shape. Beck points out further that the negative and positive flames act reciprocally on each other, the position of the former being an important factor in the establishment of this novel arc. To influence the position of the negative flame very highly loaded flame-arc carbons are used and the negative carbon is placed at an angle with the positive electrode.

According to the German imperial patent No. 262,913 (1910) or the United States patent No. 1,029,787 (1912), Beck cools the electrodes by a current of gas which protects the carbons from premature combustion and prevents injurious leakage of the current from the shell, thus permitting the maximum concentration of current in the crater. By the concentration of current and reduction in radiation due to the deeply hollowed crater an extremely intense heat is obtained in the crater. In this way the vapors in the hollow of the crater are made to emit the maximum amount of light, which in conjunction with the white incandescence of the crater gives an exceptionally strong illuminating action. The negative carbon may be a pure carbon, however. Patent No. 262,913 mentions metallic salted carbons for this purpose, too.

According to descriptions* of the Beck lamp, the positive carbon, arranged in the axis of the reflector, rotates and is guided in a holder provided with ribs for cooling purposes. This holder is stationary and the carbon slides through it, the feed being controlled by a thermostat placed so that the light or heat from the arc is radiated on it only when the crater is at the focal point of the reflector. If the crater shifts out of its correct position, the thermostat closes contacts, thereby putting and keeping the feeding mechanism in operation until the proper position of the crater has again been obtained. The negative carbon is also held in a holder similarly to the positive carbon, arranged at a slight angle to the positive carbon. The burning ends of the carbons and the inclosing shell were cooled in the lamp described by McDowell by hydrocarbon vapor.

According to McDowell, the luminous power of the 44 in. (111.76-cm.) Beck searchlight is about five times greater than the luminous power of the 36-in. (91.44-cm.) standard searchlight and about two and one-half times greater than the 60-in. (152.4-cm.) standard searchlight with pure carbon arc. According to Mr. Wedding, the luminosity of the 110-cm. Beck searchlight at 150 amp. amounts to about 500,000,000 cp.

The searchlamp† developed by Elmer A. Sperry is not very unlike the Beck lamp in its distinguishing features. From an article describing the Sperry lamp it appears that the same electrode dimensions are used as in the Beck lamp, but in the Sperry lamp the carbons burn off more quickly, i.e., 13.5 in. (343 mm.) per minute. In comparison therewith the positive carbon consumption taking place in the Beck lamp when the carbon shell at the tip is cooled by gas is 200 mm. to 240 mm. per hour. Mr. Beck provides for greater carbon consumption (400 mm. per minute) in United States patent No. 1,086,311.

The voltage employed across the Sperry lamp is also about 70 volts, and forced cooling of the electrode holder is employed. This arrangement has also been described in patent No. 203,549 by Gebr. Siemens & Company, as mentioned before. Beck used cooling ribs on his holders. The arrangement of the carbons and the rotary feeding of them are also similar in the Beck and Sperry lamps, likewise the automatic holding in focus of the crater with the aid of a thermostat.

The functions performed by air cooling in the Sperry arc and by the improperly termed gas (alcohol) cooling in the Beck lamp are totally different. In the first the process merely cools the holders, whereas in the second the alcohol flame exerts a direct influence on the arc, confining the light-giving source and thereby reducing wide dispersions of rays.

In the latest patent literature on searchlamps we find United States patent No. 221,917 applied for by Elmer A. Sperry on June 28, 1915, "Method of Operating Flaming-Arc Lights for Projectors." In the opinion of the author, this patent offers nothing new, since from

FIG. 7—TWO-FLAME ARC FROM BECK LAMP

the Beck patents we know that a positive flame and a negative flame are obtained and that the negative flame emanates from the negative carbon with great velocity. We also know that a reciprocal action of these two flames exists in such a way that there is, so to speak, a pressure. The inclined arrangement of the negative carbon, as well as the use of cores for the negative carbon with "arc-supporting material," are also known.

*ELECTRICAL WORLD, July 25, 1914; *Elektrotechnische Zeitschrift*, Aug. 6, 1914, and a treatise by C. S. McDowell in the *Proceedings A. I. E. E.*, February, 1915.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

AN INEXPENSIVE METHOD OF GROUNDING TO WATER MAINS

Company Which Owns Both Light and Water Utilities Makes Grounding Provisions While Laying Water Pipes

A company in the Northwest which owns both the electric and the water plant in a small city has worked out a scheme of grounding to water mains which it considers better than the method of grounding to a brass plug. When the water mains were being laid, pieces of bare No. 4 copper wire were carefully tinned and sweated into the lead which was used to form the joints between the sections of pipes. One end of the wire was left protruding to afford an easy connection. The ground leads connected to these protruding wires thus are tapped directly into the joints of the water piping. Engineers who discussed the feasibility of the plan before it was attempted felt certain no trouble could result from it. The possibility of the ground wire carrying enough energy to melt the lead in the pipe joint was remote.

BEARING PITTING IN MOTOR-GENERATOR SETS

Two Engineers Differ on Theory of Cause of Trouble but Give the Same Method of Overcoming the Difficulty

Grounds and weak insulation are given as the cause of bearing pitting* by P. A. Borden of the engineering department, Hydro-Electric Power Commission of Ontario, whereas an engineer in a Southern town claims that eddy currents are set up in the iron of the armature structure by short-circuited or otherwise damaged laminations. The latter engineer thinks that if leakage current is the cause it would burn out the coils in a short time. Both of the men say that the best way to remove the trouble is to insert thin sheets of insulating material between the bearing shells and their housings in order that the stray-current circuit may be broken.

Referring to a previous experience, Mr. Borden states that in one case a brush placed on one end of the shaft to reduce sparking on the journals and oil rings fulfilled its service at that end but greatly increased the sparking of the other journal. With a brush placed at each end, the current was so great that the brushes were heated to a prohibitive temperature. Further experiments showed that this current gave readings of several hundred amperes when measured either with a shunted D'Arsonval type meter or with an induction-type instrument through a series transformer. Oscillograph records indicated the current to be a mixture of unidirectional and alternating current, the latter having a periodicity of 60 cycles per second.

In this case the trouble could not have been due to leakage because the machines were operating at a lower frequency than 60 cycles. It was thought that the small electromotive forces responsible for these currents were generated in the shaft and other rotating parts by homopolar induction. The source of reversals was assumed to be an alternating field caused by the changing relative positions of the armature poles and the pole pieces. The generator was an eight-pole machine running at 300 r.p.m., and the armature spider had six spokes. Assuming two spokes to be in line with two north poles, the leakage flux would pass in through those spokes and flow along the shaft toward the bearings, electromotive forces being generated by homopolar induction at these points where the flux had a component perpendicular to the axis of rotation. It may be seen that with an advance of 15 deg. the leakage flux would be reversed by two spokes coming beneath south poles. There would thus be a leakage flux, reversing its direction every 15 deg. of rotation of the armature—that is twenty-four times per revolution, or 7200 times per minute. This flux both by generator and by transformer action would therefore be responsible for 60-cycle potentials.

Insulated sheets were inserted between the bearing shells and their housings to remedy the trouble, and it has not recurred during the seven years which have since elapsed.

COMPACT ROOF ARBOR FOR OUTGOING 2300-VOLT LINES

Large Number of Outgoing Circuits Arranged for Easy Inspection and Maintenance—Tension of Individual Circuits May Be Varied

An unusually well-arranged roof structure for outgoing 2300-volt lines has recently been erected at the Daniel Street station of the Rockingham County Light & Power Company, Portsmouth, N. H. This plant is being remodeled by the Harry M. Hope Engineering Company, Boston, and an important part of the work is the rearrangement of the wiring. An electrical bay on the south side of the station is being altered to carry an extended oil switch and bus structure installation. This bay is only about 12 ft. (3.7 m.) wide, and on account of its proximity to the street could not be extended. The equipment, however, is arranged so that the various circuits can be reached with the utmost ease and safety and without confusion as to their identity.

From the bus and switch structure the outgoing lines are carried in conduit across the bay in floor ducts and thence upward along the face of the wall to distributing centers, from which leads are run to sets of Thoner & Martens disconnecting switches installed in a long bank about 11 ft. (3.35 m.) above the floor. From each switch group the leads are carried through vertical con-

*See also ELECTRICAL WORLD, April 13, 1918, p. 778.

duit lines to conduits at the roof level. Extending above the roof level and protected against the effects of the weather by tile and concrete housing is a steel structure consisting of 8-in. channel inclined sections which carry the dead-ended lines of Fig. 2. These lines are arranged in six horizontal and six vertical groups and are connected to the leads in the conduits by triple-

FIG. 1—SCHEMATIC ARRANGEMENT OF WIRING BETWEEN DISCONNECTING SWITCHES AND OUTGOING CIRCUITS

braid weatherproof wire. General Electric Company multigap lightning arresters are mounted in six horizontal groups of six each, slightly above the level of the conduits, and short taps from the outgoing phase wires are connected to the arrester terminals. Locke insulators with wooden pin tops are used to support the weatherproof risers below the lightning-arrester taps,

FIG. 2—ROOF TERMINAL STRUCTURE FOR OUTGOING CIRCUITS

and a No. 3/0 B. & S. gage insulated wire is carried as a common return to earth from the arrester sets.

The thirty-six wires forming the outgoing circuits are run horizontally from the wire arbor through Thomas corrugated-wall bushings set into the brick wall of the arbor house and thence to Thomas suspension insulators mounted on the steel framework outside the house on the roof, as shown in Fig. 2.

Between each row of horizontal wires the vertical distance is 18 in. (45 cm.), but as the steel framing slopes from rear to front, a free working space is allowed at the taps to each group of outgoing conductors. An operator can vary the tension in any outgoing circuit without interfering with the others. The horizontal spacing between adjacent wires is 12 in. (30 cm.), and the interior of the arbor is very accessible, thus allowing easy maintenance.

RESISTANCES IN PARALLEL DETERMINED GRAPHICALLY*

Simple and Fairly Accurate Method for Finding Resistance of Network Without Detailed Calculation—Accuracy Depends on Size of Chart

BY A. S. L. BARNES

Calculation of resistances in parallel entails a considerable amount of routine work which can be eliminated by means of the graphical system shown here.

ANY NUMBER OF RESISTANCES IN PARALLEL CAN BE DETERMINED WITH A STRAIGHT EDGE AND THIS CHART

This gives a simple method whose accuracy is directly proportional to the size of chart used.

As shown in the accompanying diagram, ordinate and abscissa scales are marked identically on cross-section paper, and a line is drawn from the common zero point at an angle of 45 deg.

If it be assumed that three resistances in parallel are 62, 43.5 and 13 ohms respectively, the ease of determining their total resistance is seen by reference to the chart. The resistance R_1 is measured on the ordinate scale and resistance R_2 on the abscissa scale, or vice versa. These line joining the scale points representing these values will cut the line OX at a point which, projected on either scale, will give their joint resistance in parallel. This new value, 25.56 ohms, if joined to a

*The writer forbears claiming any priority of discovery for this method, though inquiry among several other engineers has revealed no knowledge on their part of the method in just this extremely simple form. Reference to available handbooks, technical magazines, etc., has likewise been fruitless in this respect. On this account the method seemed to be worthy of publication even at the risk of a possible charge of plagiarism.

point on the opposite scale representing R_s , will give a new value, 8.62 ohms, which represents the combined resistance of the three circuits in parallel. This scheme can be extended to include any number of resistances in parallel.

CALCULATING THE LIFE OF INCANDESCENT LAMPS

Obtaining Number of Hours Lamps Are in Service
by Use of Formula Applicable to Systems
in a Stable Condition

BY H. A. SNOW

Engineer Detroit Edison Company

The determination of life of incandescent lamps by the method of noting the time at which the lamps are lighted and keeping a continuous record is cumbersome and not practicable except for laboratory experiments. If a system has reached a stable condition, the average-lamp life may be calculated provided that complete records have been kept. These records should contain the number of kilowatt-hours supplied to the system in any given space of time, the number of lamp burn outs which are replaced during this space of time and the average rating per lamp in kilowatts of all the lamps in service on the system. The formula for finding the lamp life will then be: Lamp life (hours) = kilowatt-hours supplied \div (number of burn-outs \times average kw. per lamp).

The accuracy of this formula can be proved from the fact that in a system that has reached a state of equilibrium the average lamp life equals the total number of lamps burning multiplied by the hours burning divided by number of burn-outs.

The first formula is obtained by multiplying the numerator and denominator by the average kilowatts per lamp. The numerator will be: Total lamps burning \times hours burning \times average kw., which is equal to the total number of kilowatt-hours supplied.

The equation is applicable to any lighting system and may be applied to the entire lighting load of a central station. If the lamp life is known, any one of the other three factors could be determined.

A WAR-TIME EXPEDIENT FOR SUPPLYING SERVICE

Standard Distribution Transformers Connected Inside Delta Transformer Bank to Serve as Boosters Where Proper Units Were Not Available

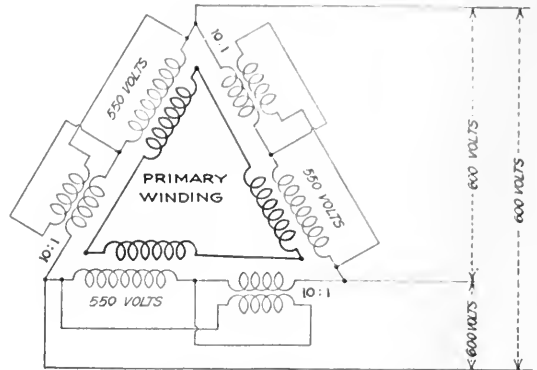

BY J. R. BALDWIN

Being called upon to serve a customer having 600-volt apparatus and having only 550-volt transformers without taps for the service, a Southern power company employed the following scheme to get the higher voltage: Three 50-kva., 1100/110-volt distribution transformers were connected so that the low-voltage windings were in series with each of the 550-volt transformers, the high voltage (1100-volt) windings being connected across the 550-volt terminals of the large transformers. The connections are shown in the diagram reproduced.

By connecting the distribution transformers directly across the secondaries of the larger transformers as

shown, the boosting voltage was brought in phase with the large transformer voltage and added directly to it.

The current in the delta is not so large as the line current, being equal to the line current divided by 1.73, and hence smaller transformers were used than could have been used if they had been connected

SUPPLYING 600 VOLTS FROM 550-VOLT TRANSFORMERS MADE
NEW EQUIPMENT UNNECESSARY

in the lines. No fuses were connected in the high-voltage sides of the distribution transformers as the voltage on these windings would reach an excessively high value if open-circuited, the action being similar to an open-circuited current transformer. This installation has given excellent service for a period lasting more than six months.

INCREASING ACCESSIBILITY OF CURVE-DRAWING METERS

Meter Case Sawed Diagonally Facilitates Maintenance and Adjustments—Chart Roll Can Be Replaced Without Loss of Time

To increase the accessibility of the interior mechanism of a curve-drawing meter used by the Cumberland County Power & Light Company, Portland, Me., the meter case was sawed diagonally into two parts as shown in the illustration presented herewith. When the case is opened on a bias, the clock mechanism and paper carrier project enough to bring them within easy

ROLLS CAN BE QUICKLY REPLACED DURING A TEST

reach for repairing, ink-well refilling, etc. When a test is in progress the roll can be quickly replaced. The instrument was originally fitted with a hinged cover and considerable time was wasted in reaching the mechanism.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

CLASSIFICATION OF SALES DEPARTMENT EXPENSES

Records of Eastern Company Show that Profit of
Department Is Covering All Expenses and
Leaving a Satisfactory Margin

With the increasing effort on the part of central stations to eliminate the waste in the routine of administration and develop sales department work to a point where it will be self-supporting, the question of expense classifications becomes important. The following figures from an Eastern central station are therefore interesting. This company maintains a sales department under which it operates a very complete electric shop. It also is very active in the sale of electric motors through its power engineers. In 1917 the total selling expense amounted to \$78,049.24, which was classified under the following heads:

	Per Cent
Salesmen's salaries.....	42
Salesmen's expenses	3
Stationery and printing.....	1
Postage	1
Telephones and telegrams.....	4
Rent	3
Miscellaneous supplies and expenses.....	3
Electric shop expense.....	29
Main office and three branch offices.....	5
Newspaper advertising	3
Miscellaneous advertising	1
Promotion work	5
Total	100

The gross profit on the sale of merchandise by this organization last year amounted to \$58,822.53, not including motors. This means that the sale of merchandising alone is already carrying 75 per cent of the entire sales department. In 1916 these sales covered 50 per cent. By including the profits of the power department the entire expenses of the selling function were covered last year, however, with a very satisfactory profit.

THE PUBLIC AS PROTECTOR OF LABOR AND CAPITAL

Pacific Coast Company Undertakes Educational
Work to Show Citizens Their Relation
to the Public Utility

In an effort to educate the public to the relation that exists between the people, the city and the utility, the Puget Sound Traction, Light & Power Company of Seattle, Wash., has been running occasional paragraphs in *The Electrogram*, the bulletin which the company distributes to the public. The latest, entitled, "Public Must Protect Employees and Investors," follows:

The public has a right to expect from a utility the best service possible at the lowest cost possible under the most efficient management, taking into consideration, of course, the conditions and cost elements involved; but the public loses sight of its own interests if it fails to recognize the

rights of the utility's employees and of the investors whose money has made the existence and operation of the utility possible.

The public needs the service, and in response to that need the utility came into existence. It was created to furnish the service the public requires. That at once created a community of interest between the public and the utility, and that interest is a fixed factor in community development. It was necessary first to find investors to construct the utility and workers to operate it. The operation is essentially for the benefit of the public.

The employee has a right to wages that will conform to the value of the service rendered—not to the company, but to the community. He is entitled to fair treatment and to a fair attitude on the part of the public toward the utility in which he is interested as a worker.

The investor is the real foundation stone of the organization. Without him there could be no utility, and without the utility the public would be without service, which would force the community to stagnate and to cease to expand and develop.

So when the public compels the investor to suffer by treating him as if he were an outsider not entitled to consideration it loses sight of its own interests.

No community can afford to destroy the confidence of investors in its fairness and integrity.

COMPANY'S EXPERIENCE WITH EMPLOYEE LOAN FUND

Amount of \$200 Laid Aside for the Emergency Use
of Employees in Sums Which Range
from \$10 to \$50

Some time ago the New Bedford (Mass.) Gas & Edison Light Company instituted a loan fund for the assistance of employees who might be in need of a little extra money to meet emergencies. The fund consists of the sum of \$200, which has been laid aside by the executive committee to be loaned to employees who on account of illness or for some other good reason have got behind in the payment of their regular expenses. The money is issued in sums of from \$10 to \$50 upon receipts signed by the employee, with the understanding that from one to two dollars a week will be taken out of his weekly pay to reimburse the company for the money advanced. No interest is charged.

The receipt is given to the employee after the full amount has been restored. In commenting on the working out of this idea, Charles R. Price, treasurer of the company, gives these interesting details:

We have had several occasions calling for the use of this fund. While it was started to help in particular emergencies, we have applied it for some half dozen of our employees. Our first case was one of the line gang who had been injured and, while his pay through the insurance and this company was kept up to the full amount, his wife was obliged to go to the hospital to await the expected baby and the three young children at home had to have a housekeeper to look after their daily wants. These expenses were beyond the daily receipts of the employee and the allowance afforded was very welcome.

Another case was where one of our employees had recently moved from another city and needed some extra

money in order to move his furniture and start housekeeping in a proper way. Another case was that of a man who had started housekeeping with a very meager allowance for furniture and had an opportunity to purchase an outfit from an acquaintance who was leaving the city. Another loan was to a man who wanted to enlist but owed several bills about the city for clothing, etc.

It is the practice of this company to pay all employees full wages if injured in our work for the two weeks that are not covered by the insurance policy and to assist them through the period of convalescence. We have also kept up the pay of all employees who enlisted or have been drafted into the service, paying their families the difference between the government pay and what they were receiving while in our employ.

ANALYSIS OF CONSUMPTION BY SMALL LIGHTING CUSTOMERS

Of Residential Customers 71½ Per Cent Use Less than 20 Kw.-Hr. Monthly as Against 34 Per Cent of Commercial Customers

In preparing a new lighting rate for presentation before a public service commission, a central station found it necessary to analyze the monthly consumptions of small lighting customers. A year's business was taken as a basis in order to eliminate discrepancies between winter and summer requirements, and the customers consuming 20 kw.-hr. or less per month were tabulated in groups by consumption and further divided into residence and commercial classes.

The curves (Figs. 1 and 2) show the results of this analysis, the figures being transformed to a percentage basis. Taking first the curves for residence lighting customers, it will be noted that, eliminating the unusual number of customers having a consumption of 14 kw.-hr. per month (this being the only point which does not fall close to a smooth curve), customers having a monthly consumption of 12 kw.-hr. exceed the rest in number, while the energy curve reaches a maximum at about 15 kw.-hr. It is interesting to note that customers falling into this class (20 kw.-hr. per month or less) constitute 71.5 per cent of the total residence lighting customers on this company's lines.

FIGS. 1 AND 2—ANALYSES OF RESIDENCE AND OF

than the small residential customers. But 34 per cent of the commercial lighting customers fall into the group having a monthly consumption under 20 kw.-hr., and their consumption aggregates only 3 per cent of the

TABLE I—DATA ON RESIDENCE LIGHTING CUSTOMERS

total for commercial lighting customers. In the particular district here considered commercial lighting customers were 16 per cent as numerous as residence lighting customers; however, their total requirements

COMMERCIAL LIGHTING CUSTOMERS' CONSUMPTION

Their aggregate consumption amounts to 43.9 per cent of the energy taken by all residence customers. The relative importance of the higher classes of residence customers from the standpoint of numbers and energy requirements is shown in Table I.

As might be expected, the small commercial lighting customers are, relative to the rest of their class, of less importance both as to numbers and requirements

aggregated 83 per cent of the consumption of the residence customers. This is of course due to a number of large consumers. The minor importance of the small commercial lighting customers as compared with those of higher consumption is illustrated in Table II.

The city district from which these figures were taken has a population of about 90,000. There are no private plants.

TEN VITAL POINTS FOR ELECTRIC RANGE SALES

In Addition to a Proper Education of Salesmen and Customers, the Central Station Must Always Stand Ready to Serve

BY F. J. ALLEN

Electric Range Specialist, Westinghouse Electric & Manufacturing Company

There are at least ten vital points which every central station should take under consideration when considering the question of range campaigns. A thorough co-operation of the commercial, engineering, construction and bookkeeping departments is the first necessity. The heads of these departments should meet and have a complete understanding of what the central station is contemplating, so as to make the necessary adjustments in their respective departments to give the greatest assistance possible.

The next step is to prepare the selling force. In this connection it is suggested that the assistance of a specialist from the factory be secured. It is essential that the men be sold on the idea of cooking by electricity, its great conveniences, economy and cost. This leads to vital point three, namely, a thorough instruction as to the construction, operation and care of the range. The specialist will undoubtedly lay emphasis on the fourth vital point, that the sale of the range consists of three distinct steps, the sale, the demonstration and the servicing.

Next, the interest of the public must be aroused. Nothing appeals to the public more than demonstration lectures, and here again the support of a factory specialist is advisable. The cooking of an entire meal before an audience of carefully selected "prospects," during which a lecture is given as to the economies, conveniences, fundamental differences and cost of electricity as compared with coal or gas, is an attractive method of procedure. The presentation for inspection of the finished meal at the completion of the lecture is the crowning event of the demonstration. Care should be taken to see that a complete list of those attending the lecture is made for follow-up purposes.

A systematic method for following up these prospective customers is highly essential and can best be handled along the card-index system plan. For every "prospect" there should be a card, and the result of each visit should be listed thereon. When a range is purchased this card should go into the "sold file," and upon it should be kept a detailed report of the operation and servicing of the range, dating from its installation and demonstration. It will be found that this record of dealings with the customer will often prove highly valuable in handling complaints, etc.

It is generally admitted that a deferred-payment plan is necessary. However, whether purchased for cash or on deferred payments, it is advisable to have the buyer sign an agreement according to the plan of purchase, as the signing of such an order has a psychological effect.

The necessity of sufficiently heavy wire and proper transformer capacity is obvious; but in addition every range should be thoroughly explained as well as the fundamental difference between cooking with coal and with gas or electricity. Nearly all ranges are accompanied by instruction books.

Number nine in the vital points is particularly im-

portant, for there is nothing like satisfied customers as a means of desirable advertising. There are bound to be questions arise from time to time regarding the cooking of certain foods, and the author has found that the best solution of these was obtained by getting the different users of the range together. Clubs have been formed of all the purchasers, they electing a president and a secretary. Weekly meetings are held at the homes of the members, the first hour being given over to general discussion of successes and failures. Each member brings a written report on a small card previously given out by the secretary, setting forth the ingredients and electric instruction for the most satisfactory dish she has prepared during the week. These cards are filed at the central station as a "ready recipe" reference for members of the club. The hostess then prepares and cooks some favorite dish as an object lesson for the other members of the club. The meeting is written up in the local papers, and the advertising secured thereby is of the highest character.

The observance of all the foregoing points will have little weight unless the central station equips itself with the necessary parts for quick replacement of any portion of the equipment which may prove defective.

GETTING DELAYED METER READINGS BY POST CARD

Customers Are Asked to Mark the Position of the Meter Hands in Cases Where Reader Could Not Get the Record

Much time is lost by the meter reader through customers not being at home when he calls. In order to get around this difficulty the Twin State Gas-Electric Company of Brattleboro, Vt., asks the customer to read his

10,000 1,000 100 10

Will you kindly assist us in obtaining a reading of your meter by marking the position of the hands on your meter on the illustration and mailing us this card.

Date of Reading _____

Meter Number _____

Name _____

Address _____

POST-CARD METER RECORD

own meter when the company's reader has not been able to do so on his regular calls.

If the meter reader cannot get in, he slips an addressed post card, like the one shown, under the door or puts it in the mail box. This delayed-meter-reading card requests the customer to mark the position of the hands of the meter on the card and mail it to the company. The same consumer is seldom asked to make his own meter reading for two consecutive months; therefore any inaccuracy in the customer's reading is corrected by the company's man on his following visit. Experience shows that the consumer much prefers this method to having his bill figured on the basis of last year or to being billed for two months next time. Space on the card is provided for the date of reading, the meter number and the name and address of customer.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Types of Induction Motors.—J. W. KIRKLAND.—The slip-ring motor is primarily a variable-speed machine and is essential for such purposes as hoisting or variable speed traction. This type is capable of exerting a very high starting torque while taking current approximately proportional to the torque. Practically 90 per cent of the total cost of maintaining motors is in connection with collector rings, brush gear and the external starting arrangements such as liquid starters or controllers. The squirrel-cage motor possesses great advantages over the wound-rotor type for all purposes where the requirements are not for variable speed or exceptionally high starting torque. There are no difficulties in building squirrel cage motors to run at a speed of 1500 r.p.m.—*Journal of South African Institution of Engineers*, April, 1918.

Armature Reaction in Single-Phase Alternators.—F. D. NEWBURY.—A continuation of an article on "Armature Reaction of Polyphase Alternators." The single-phase type of machine can be investigated as to armature reaction in the same manner as a three-phase machine by constructing successive flux diagrams showing the single-phase armature flux during the actual rotation of the field. The effect of lagging current and the cage winding in producing a flux wave is given, together with the armature flux waves taken at several different times. The time and space relations of the flux set up by the armature cage windings are also illustrated when constant armature flux is assumed. A comparison of the result and fluxes shows that the field established by a single-phase cage winding is a rotating field of constant value as in polyphase windings, but the speed of rotation with respect to the rotor is twice that of the rotor speed and the direction of the rotation is opposite to that of the rotor. The effects of armature reaction on generated voltage, the power-factor effects and the results of the armature-flux cage winding are the same for the single-phase as for the polyphase machine with a few exceptions.—*Electric Journal*, May, 1918.

Essentials of Transformer Practice, Part X.—E. G. REED.—The object of this section is to give a general analysis of transformer problems without the use of mathematics. Different types of construction, selection of transformer types and the effect of changing the proportions of a transformer are considered. The ratio of the iron and copper areas and cross-sections to the distributed shell and core types are compared. Two methods of designing are outlined and methods of changing the losses after the transformer has been designed are considered.—*Electric Journal*, May, 1918.

Generation, Transmission and Distribution

Using Volcanic Steam in the Production of Energy.—The province of Tuscany, in Italy, is seamed with volcanic crevasses which emit steam and gas at high

temperatures. In 1916 Professor Luigi initiated a project to use this steam to produce electric energy. It was found impossible to apply it directly to the prime movers without damage to the machinery, but by mixing it with pure water it was found practicable to use it with low pressure or medium-pressure boilers without any harm resulting to the steam turbines. At the present time the cities of Volterra, Massa, Sienna, Leghorn and even Florence are receiving at 16,000 volts and 36,000 volts energy generated by this means in a power house where the installation is composed of 3000-kw. turbo-alternators driven by 4000-hp. turbines. It is proposed soon to extend the application of the system to large steel foundries which are now entirely dependent upon coal. It is too early to give exact figures as to the economic saving that may be looked for, but the promoters evidently expect this to be large.—*L'Industrie Electrique*, May 10, 1918.

Efficient Combustion of Bituminous Coal with Under-feed Stokers.—RUSSEL C. HINE.—In discussing this subject the author considers chiefly the kind, quality and characteristics of the fuel, thickness of the fuel bed, rate of feed, formation of clinker, draft and furnace construction. From an operating viewpoint the over-all efficiency decreases as the amount of volatile increases. The rapid distillation and heating that occurs when the furnaces are forced may result in incomplete combustion if the combustion chamber is not of ample size or if the air supply is not properly regulated. The article contains a curve showing the percentage of volatile in coal and illustrations of under-feed stokers.—*Industrial Engineering*, May, 1918.

Installations, Systems and Appliances

Acid-Proof Alloys.—Some experiments by Dr. R. Irrmann, described in *Metall und Erz*, have an interesting bearing on acid-proof alloys. It has been assumed that electrolytic corrosion tests of voltaic couples of two metals afford an indication as to the corrosion of the alloys of those metals. The investigation by Dr. Irrmann of alloys of copper and nickel, to which tungsten and iron were further added, apparently disproves this assumption. Much depends upon the proportions and the formation of compounds. An alloy of nickel with 20 per cent of tungsten was more resistant to attack by strong hot sulphuric acid than nickel alone, but was difficult to machine and expensive. A voltaic couple of nickel and copper gave an emf. of 0.55 volt, which soon decreased to 0.25 volt. The nickel was dissolved, the copper becoming polarized with hydrogen. An alloy of 47 per cent copper and 4.98 per cent tungsten proved highly persistent and mechanically strong. The electric resistance was greater than that of constantan. Very good results were also obtained with ternary nickel—tungsten—copper alloys. But quaternary alloys, containing also iron, proved far superior to the ternary alloys.—*London Electrician*, April 26, 1918.

Electrophysics and Magnetism

Thermo-Electromotive Force of Some Alloys.—M. A. HUNTER and J. W. BACON.—The measurements were obtained by joining a number of the wires directly to a standard iron-constantan thermocouple with soft Swedish iron wire. The standard thermocouple indicated the temperature of the hot junction. Nickel-chromium-alloy, copper-nickel chromium, iron-nickel, iron-nickel-chromium, nickel-manganese and iron-nickel-manganese curves and tables are presented. Nickel chromium alloys and copper-nickel-chromium alloys will meet all conditions which have been laid down for a satisfactory thermocouple because their curves are approximately straight lines. The materials have a high melting point and resist oxidation very well.—Extracted from paper presented before the American Electrochemical Society, April 28-May 5, 1918.

Electrochemistry and Batteries

Catalytic Action of Carbon in Batteries.—Contribution to the Société Internationale des Electriciens by M. Fery. Depolarization is effected through the action of the air, but the part played by the carbon in this action is somewhat obscure. On first thought it would seem that the only factors of importance in facilitating the catalytic action of carbon in conveying oxygen from the air are the nature of its surface and its porosity. But experiments have shown that the constitution of the carbon is also of importance. Seeing that all catalytic agents are affected by the presence of small impurities, it is hardly surprising that carbons apparently similar differ widely in their behavior. Moreover, certain qualities of sal ammoniac containing traces of iron and lead also hinder the action of catalysis. The presence in the pores of the carbon of a gelatinous film of metallic hydroxide has a deleterious effect. The purity of the carbon is therefore a vital factor. Some results are given for batteries using the special carbons manufactured by the Société Gallot as a result of M. Fery's researches. A battery containing 100 gm. of sal ammoniac with 77 gm. of zinc, and supplying 20.8 milliamperes (0.5 amp.-hr. per day) consumes 1.27 gm. of zinc per ampere-hour, as compared with a theoretical consumption of 1.2186 gm. The efficiency is thus nearly 95 per cent. The consumption of sal ammoniac was also considerably decreased, being only 1 gm. per ampere-hour. If the above current is maintained by adjusting the external resistance, the emf. falls from 1 volt to 0.5 volt in four months, and the cell will then continue in action if the zinc is reversed.—London *Electrician*, April 19, 1918.

Telegraphy, Telephony and Signals

Synchronous Signaling and Safety at Sea.—Recent developments in methods of signaling between ships and shore stations, as well as between ships at sea, with the object of averting collision, were outlined by Prof. J. Joly before the Royal Institution on April 9 and 10. He said that the difficulty attending the use of light signals in foggy weather has been overcome by the use of wireless signals. The latest type of Fessenden oscillator has opened up new possibilities in sound signaling in water, this device enabling the range of audibility to be increased up to 30 miles per hour and also permitting signaling by Morse code by the ordinary telegraphic key. Furthermore, the receipt and emission of signals

can be accomplished by the same apparatus. To these advantages are added the possibility of locating icebergs by reflection of sound and the determination of depth of water beneath moving vessels by echo from the sea bed. The latest development is the employment of wireless telephony. The installation of the radio-phone on the De Forrest system at Point Judith, on the western approach to Narragansett Bay, is the first of its kind. This station communicated its name over a considerable distance and on vessels approaching within the danger zone gave a second warning.—London *Engineer*, April 19, 1918.

Miscellaneous

Relative Resistance of Various Hard Woods to Injection of Creosote.—CLYDE H. TEESDALE and J. P. MACLEAN.—When wood is impregnated with preservatives some species are more easily penetrated than others, so that for proper treatment the species should

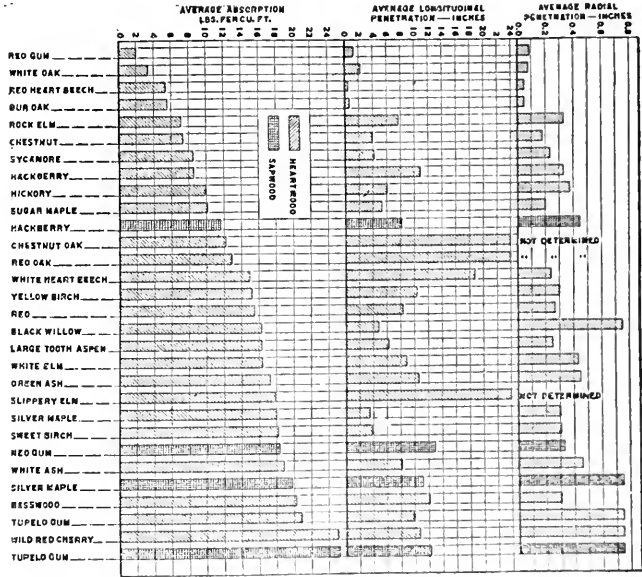

CHART OF ABSORPTION CHARACTERISTICS FOR VARIOUS HARD WOODS

be grouped according to their relative resistance to injection, otherwise part of a cylinder charge might receive a heavy treatment and another part a very light one. The accompanying chart shows the relative absorption characteristics of different kinds of pole timber. A very complete bibliography of departmental publications on this and allied subjects is included.—*Bulletin No. 606, U. S. Department of Agriculture.*

Pulverized Fuel.—(Report of fuel and fuel-handling committee of the Naval Consulting Board.) In addition to the definite economies that have been claimed for the use of pulverized coal as a fuel in stationary practice, there are other advantages which occur in marine installations that help military operations. By a simple and immediate adjustment of the burners powdered coal as a fuel may be made to emit dense clouds of smoke to serve as a screen; in an emergency the ship's boilers may be rapidly forced; a great reduction in the fire-room force is effected as compared with the use of solid coal; the supply of fuel oil in the United States is limited, and a means of conserving fuel oil for naval vessels already equipped to burn oil is necessary.—*Journal of American Society of Mechanical Engineers*, May, 1918.

Reversing Motor-Planer Control

To the Editor of ELECTRICAL WORLD:

Sir: The subject of reversing motor-planer control, covered in the Jan. 12 issue, points out the feature of dynamic braking for every reversal of the platen when the machine is producing work. From this the reader would be inclined to believe that this feature is essential and the only means of operating satisfactorily.

Dynamic braking is not necessary for the most efficient operation, when the planer is in service. With one system particularly familiar to the writer the motor is thrown directly into reverse just before the platen reaches the end of the stroke, but the armature current is limited to a fixed amount by proper proportioning of the resistances. Two starters are used mounted on the same panel. When the table switch is tripped by the "dogs" the motor is started up in the reverse direction on the idle starter, with no loss of time and without first slowing up the platen by dynamic braking. This gives a quicker, smoother and more accurate reverse than with any system using the dynamic brake. It has also been demonstrated with this system that a truer line of reversal is obtained; that is, the point at which the tool stops will be practically along the same straight line at each reversal. On a recent test, a 35-hp. controller of this type showed a variation of $\frac{1}{4}$ in. (0.63 cm.) on a 2-ft. (0.608-m.) stroke, which is closer than can be obtained by dynamic brake. This is often important when working to a recessed shoulder, etc.

In the system mentioned dynamic braking is applied only when the operator desires to stop by push-button or tumbler-switch control, overloads or failure of voltage. This system gives all the desirable features of jogging and hand control when setting up work and a longer life to the contacts.

MONITOR CONTROLLER COMPANY,
W. G. Merowit, District Manager.
Baltimore, Md.

Ventilating Cable Ducts

To the Editor of ELECTRICAL WORLD:

Sir: In an editorial in the April 20 issue of the ELECTRICAL WORLD entitled "Ventilating Cable Ducts" you make the following statement: "The experiments described by Messrs. Keating and Mueller are certainly of considerable value in showing for the first time on a really practical scale what can be done if necessary to keep down dangerous temperature in high-tension cables." The experiments referred to were in connection with the cooling of ducts with forced ventilation, a method studied by the Duquesne Light Company of Pittsburgh, Pa.

Some very careful tests of this kind were made by the writer about fifteen years ago, with the result that the temperature was found to "build up" toward the exhaust end of the conduit and, unless an extraordinary amount of energy was used to drive the air through the ducts at high velocity,

Readers' Views and Comments

higher temperatures of the cable resulted than if the blowers were not running. These tests were made in a 200-ft. (60.9-m.) section of conduit. This "building-up" effect would be much greater where the manholes are the usual distance of 400 ft. or 500 ft. (122 m. to 152 m.) apart.

Beginning on page 233 of Volume XXXIV of the *Transactions* of the American Institute of Electrical Engineers, there is a paper by the writer on "Effect of Moisture in the Earth on Temperature of Underground Cables." The method there described has been adopted by the Niagara Falls Power Company to "keep down dangerous temperatures in high-tension cables" and has been in extensive use for at least six years. Two other large companies at Niagara Falls have adopted the same method of water cooling. No cable failures from electrolysis have been experienced, and if adequate bonding of cable sheaths and ground connections in manholes are provided there will be no trouble from this cause.

The installation of the plant, as well as the cost of operation and maintenance, for cooling cables in ducts by water is very slight compared with the cost of a blower plant.

Self-Inductance of Long Reactance Coils

To the Editor of ELECTRICAL WORLD:

Sir: I read with much interest H. B. Dwight's article on "Self-Inductance of Long Reactance Coils" in the issue for Feb. 9. While Mr. Dwight's work is well done and is of academic interest, it falls short of meeting practical manufacturing conditions.

In usual manufacturing it is not possible with present production methods to meet exact conditions except by overwinding a reactance and then adjusting to exact value. According to General Electric Company data No. 14,815-A, which are representative of others, copper wire is subject to variations as follows:

1. Bare diameter 1 per cent high or low down to 10 mils and 0.1 mil higher or lower below 10 mils.

2. Cross-section 2 per cent high or low down to and including 10 mils diameter.

3. Weight 2 per cent high or low down to and including 10 mils.

4. Temperature coefficient 0.00393, or $1/254.5$ per deg. C. from 20 deg. C.

On account of these variations in wire of commercial sizes and the impossibility of exactly determining spacing of wires, especially in small coils, it is not necessary to use any method which has a greater accuracy than 2 to 3 per cent.

Mr. Dwight would use several different formulas for different coil shapes. Here the error of taking the wrong formula is possible, which means elaborate checking of all results.

I have found it convenient to use a universal formula and curves based on theoretical and empirical considerations. The formula and curves are given by Brooks and Turner in Bulletin 53, University of Illinois. The Brooks-Turner formulas and curves have been checked and found to be correct for all usual engineering and manufacturing problems.

Conserving the Small Water Powers of Alabama

To the Editor of ELECTRICAL WORLD:

Sir: There are three kinds of natural material resources which the nations must conserve, and more especially should the United States and our allies at the present time use drastic means along all lines of conservation in order to win the war within the next three years. The non-renewable resources, such as coal, ore, oil, gas, phosphates, manganese, etc., in which utilization, even though without any waste, necessarily diminishes the supply for future generations, form the first class. The self-renewing resources, such as forests, which time will replace for future generations, form the second class, and water power forms the third. If water power is not utilized, it is wasted, with no good results to anybody, and instead of restriction, as with the other classes, the greatest possible use should be advocated.

Alabama is wonderfully blessed with numerous small streams where from 10 hp. to 200 hp. could be developed, and the number of large streams is great compared with most other states. Small streams which can find enough storage to produce 50 hp. ten hours a day for manufacturing purposes are saving fuel at the rate of nearly 400 tons a year and thereby rendering a great service to coal conservation.

We have to-day in our state more than 800 water-power developments ranging from 6 hp. to 50 hp., and more than eighty developments ranging from 50 hp. to 200 hp. This is only a beginning, because the future possibility for large and small water-power developments in Alabama is really great. We are now witnessing the progress of the project at Muscle Shoals, which will ultimately generate 50 per cent more horsepower than is now produced at Niagara Falls. As fuel is scarce and many power stations are greatly inconvenienced in getting their coal supply, it seems to be the proper time to diminish restriction all down the line and to use public authority so far as possible to encourage the development and utilization of every bit of water power which can be commanded.

Manufacturing Fields

CALIFORNIA'S COMMISSION ACTS IN POWER CRISIS

Takes Over the Distribution of Electricity in Central and Northern Sections and Appoints a Power Administrator

The Railroad Commission, with the approval of the electrical power companies interested, has taken over the administration of electric power in northern and central California to meet war emergencies. In connection with this action the commission has created a Department of Power Administration, to be in charge of H. G. Butler, for five years assistant chief engineer of the commission.

The power companies have agreed to have their entire output pooled and distributed by the Railroad Commission so as best to serve the need of all consumers in the present crisis, as outlined in these columns last week. The expenses of the Power Administration will be borne by the power companies. Administrator Butler has announced that no power priority list has been adopted and that effort will be made to avoid the necessity of such a list by the utmost conservation of power.

If it becomes necessary to create a priority list, this will be done only after consultation with the Food and Fuel Administrations, the Emergency Shipping Board and the Federal Reserve Board. It is hoped that the power pool will improve economy so as at least to postpone curtailment of service.

WAR INDUSTRIES BOARD SEEKS CAPITAL FOR POWER PLANTS

**Bill to appropriate \$200,000,000 to increase power supply in East is sent to Congress—
Frederic Darlington Approves**

The War Industries Board has sent to Congress the draft of a proposed bill to appropriate \$200,000,000 to increase the power supply in overloaded industrial centers of the East. Cities along the Atlantic seaboard in which munitions and materials for war are being manufactured would be the especial beneficiaries under the measure, which has been committed to the care for the present of Representative Kitchen, chairman of the House ways and means committee, on the House side, and of Senator Martin of Virginia, chairman of the appropriations committee, on the Senate side.

The measure, it is understood, was drafted by Frederic Darlington, chief of the power-plant section of the War Industries Board, at the request of Bernard M. Baruch, chairman of the board, and it is said to have the backing of President Wilson.

The measure is frankly emergency legislation, made necessary by the apparent need of the industrial section of the East for more power with which to turn

out munitions of war. It is stated in Washington that the power supply of the East is obviously overloaded, and that while different sections of the country are also raising the question of not having sufficient power with which to turn out the munitions and materials needed by the government, it is the intention of the War Industries Board to see that the Eastern section of the country is supplied first, and then endeavor, perhaps by additional legislation and appropriations, to supply other sections of the country.

Until recently, it is stated in Washington, power companies without sufficient equipment and without sufficient funds to purchase equipment had expected to be assisted in obtaining capital and equipment through the War Finance Corporation; but now that that body has ruled in a manner which makes it unlikely that power companies can be so supplied, the need for empowering legislation of a specific and emergency character becomes apparent as one of the necessities for winning the war. It is said in Washington also that some of the power companies have come to see that if they borrow money now for additional equipment which might not be needed at the end of the war they will be doing themselves more harm than good.

It is said in Washington that much more than the \$200,000,000 proposed for appropriation will be needed, inasmuch as in the Pittsburgh district alone, which supplies power for a radius of 100 miles, it is estimated that \$40,000,000 or \$50,000,000 for additional plant facilities might be needed.

Secretary Daniels at the General Electric Works

In his tour of inspection in the Empire State Secretary of the Navy Daniels visited the Schenectady Works of the General Electric Company. With national and State officials he inspected the work being done for the United States Navy Department, paying particular attention to the turbines and turbine gears for destroyers and to the electrical equipment for battleships. At noon Secretary Daniels addressed the 23,000 General Electric employees.

CHARLES L. EDGAR ON WAR AND RATE PROBLEMS

Asking to Have Boston Investigation Postponed
Until Close of the War, He Analyzes
Conditions and Prospects

President Charles L. Edgar of the Edison Electric Illuminating Company of Boston appeared as a witness on June 6 before the Massachusetts Gas and Electric Light Commission in connection with the company's motion to defer the pending rate investigation until the close of the war. He supplemented previous statements regarding the matter as published in the *ELECTRICAL WORLD* of May 18, page 1053, and June 8, page 1186.

Mr. Edgar said first that the shortage of labor in accounting departments was the cause of bi-monthly billings being considered by the larger central stations. He felt that the practice has great disadvantages, tending to increase bad debts and not cutting down accounting work pro rata. Despite the disadvantages, it may be necessary to adopt the plan. The accounting staff shortage is one of the most serious obstacles to a rate investigation under present conditions.

Referring again to the retention of the firm of D. C. & W. B. Jackson of Boston and Chicago to analyze the company's earnings and rates and point out specific prices considered too high or too low, Mr. Edgar said that on account of the inroads of the war into the staff of this firm and the recent commissioning of its heads for government service the report on rates will not be ready for some time.

"If under the circumstances we were going into an investigation such as is intimated by these questions" (presented by the advocates of a rate reduction), the speaker declared, "I am very much at a loss to know what we could do. Apparently, judging by the questions, this is proposed to be as thorough an investigation as has ever been made by anybody. It deserves all our thought and all your thought. . . . Without the help of a firm like that of Mr. Jackson, and with all of us busy on more or less important things, acute things to which we have to give our thoughts, I don't know just what we could do if we had to go on with this case."

HOW CONDITIONS HAVE ALTERED IN A YEAR

A year ago, the witness stated, the company took the position that the time had come to reduce the maximum lighting rate from 10 cents to 9 cents, and a material reduction in power prices was also in sight. This is no longer the case, in view of the extraordinary increase in expenses. Mr. Edgar estimated that daylight saving will cost the company nearer \$400,000 than \$250,000, as estimated at the last hearing.

"Dr. Garfield told us week before last in Washington," said Mr. Edgar, "that he was going to put lightless nights into effect this year on Sept. 1 and that he had no doubt there would be more workless days this winter than last."

The witness was of the opinion that a continuance of the recent dimming order of the police in the New York district would cost the central-station interests

\$1,000,000 a year. The same situation may be met in Boston at any minute.

Commissioner Schaff intimated that the company's staff might meet the demands of the investigation without the need of calling in outside assistance.

Mr. Edgar said that a reduction of 1 cent per kilowatt-hour in the present Boston price would mean about \$400,000 decrease in revenue. He had not considered the question of making a tentative maximum price for a certain period, feeling that in due course the company will have to satisfy the commission that not only should there be no decrease, but that there should be an increase, and probably a large increase, in all prices. Another million dollars of income should be obtained from existing customers within the next year or two, taking into consideration the prices that will have to be paid for coal and the loss of income from conditions beyond the company's control, such as industrial shut-downs.

THE COAL CLAUSE WILL NOT COVER ALL THE LOSS

"We will get quite a lot out of our coal clause," he said, "but we cannot get it all. We cannot even get all that we should in that way in connection with our coal, because some of our contracts tie us up for a year, and we have some longer contracts. But if we could put our coal clause on to our business we could get back half of the loss expected. The other half, if we get it, has got to come out of existing customers. . . . In normal times it is entirely possible, in my opinion, for your board, for the petitioners or for the company to decide, if prices are to be changed, where they should be changed. I think it is entirely impossible in these abnormal times for either your board, the petitioners or ourselves to determine where the prices should be changed scientifically at present.

"The whole theory of the rates is that they depend upon precedents, things that have grown up. For example, a city that had 90 per cent of its business light and 10 per cent power would have an entirely different ratio between the power and light prices from a city that had 90 per cent power and 10 per cent light. Our company is to-day in the position of not knowing what our ratios are from day to day. Our output yesterday was 25 per cent ahead of last year. . . . Now, the output of yesterday cannot, in my opinion, be figured by anybody as a proper basis of rates for the future."

In the past, Mr. Edgar intimated, rate reductions in unsaturated territory have generally been recouped in net earnings within twelve to eighteen months. The entry of the country into the war has made previous standards of prediction more or less unreliable, in view especially of the greatly increased prices in labor and supplies and the possibility of almost confiscatory taxes to help carry on the war. Under normal conditions the great bulk of new business obtained by the Boston company comes during the four fall months. After the holidays the people drift along without making changes in their living arrangements until late in the spring. Then the company in normal times gets a minor boom in new business, after which matters are quiet until after Sept. 1.

A Patriotic Reminder—Have You Bought Your War Savings Stamps?

Last summer, Mr. Edgar pointed out, he was willing to put into effect a reduction in the retail lighting rate from 10 cents to 9 cents and expected that a good part of the loss in net could be recouped by midwinter. A letter to this effect written to G. S. MacFarland, counsel for the petitioners, was introduced. At that time Mr. Edgar declared that if the price was reduced from 10 cents to 9.5 cents the result would be very largely negligible, whereas a reduction below 9 cents, say to 8.5 cents or 8 cents, would be so great as materially to decrease the company's income. The petitioners desired to know why a reduction below 9 cents did not appear feasible to the company last summer, and the answer was that the company felt it wise to offer a reduction large enough to be an incentive to secure new business but not so great as seriously to imperil its net earnings. Had the proposed reduction to 9 cents been made, the company would have utilized the occasion to conduct an extensive advertising campaign for new business; and even if it could have seen its way clear to go to 8 cents within a reasonable number of months at that time, Mr. Edgar felt that it would be good business and undoubtedly to the interest of the company and its customers to make the reduction at two different times and get the benefit of two advertising campaigns. It was then Mr. Edgar's opinion that by such a course the company would get twice as much business as though it had made only one campaign, even though the reduction was twice as much in the one as it was in each of the two.

LOSS THROUGH LOWER RATES CANNOT BE MADE UP

"Last July," said Mr. Edgar, "I thought revenue lost through reduced prices could be picked up. We know now that it cannot be. We know that the government will not let us pick it up. I have been told in the last two weeks that the government was going to stop the manufacture of appliances, heating devices and ranges, which will mean a great dropping off in new business. We are told that the general policy of the government is going to be to stop extensions. If we cannot make extensions we cannot get people to take more light, and if we cannot sell heating devices it means that our new business is going to be stopped. I am speaking now of the business that is reflected in the retail rates. I am not speaking of the war business. That is going ahead enormously, but if we cannot pick up our business we cannot get our income back by a reduction. We cannot do any advertising.

"It would be very bad judgment for us to go out and have an advertising campaign for new business, especially when we are short of money. Everybody knows we are short of money, and we cannot boom business and then refuse to take new customers; we are refusing them to-day by the hundred. It is inconceivable to me that anybody would suggest that we can afford reducing retail prices in the light of what is happening. The whole situation is in a very feverish condition. I think we know something about rates, and I think personally I know something about rates; but I would not know how to go at it at the present time, because if you pass upon the matter from a determination of conditions, conditions can change to-morrow."

Mr. Edgar said that up to Oct. 1, for six or eight months after the declaration of war, the company was going along about normally. The gross earnings were increasing 6, 8 or 10 per cent, and the net were increasing in like proportion. In November, 1917, the output dropped from 10 or 12 per cent increase to about 6 per cent. The earnings still kept up. In December the increase was only 6 per cent, and in January it dropped to minus 2 or 3. For three months the figures were minus. In April, 1918, there was an increase in gross earnings of about 5 per cent. For the first time in the history of the company its net earnings are running less than the year before, the reduction running roughly from \$23,000 to \$40,000 per month.

The coal clause has been applied to all except the company's "A" rate (retail lighting), and even if all the power customers could be billed at present on the coal clause basis, the company would make no extra profit, but would get back the exact expense to which it has been put more than it would have had to meet if it could have secured coal at the prices of 1916. At present the cost of coal is about \$2 per ton above the 1917 prices, and it will probably reach \$3 extra (against 1917) before the end of June. Mr. Edgar said that the New England Power Company has been negotiating with the Edison company for the supply of 30,000,000 kw.-hr. per year to the former by the latter during periods of low water. Mr. Edgar said that he thought the Boston Edison 10-cent rate might have to be raised to 12 cents in future, in view of the advances in prices apparent throughout the country, and especially as evidenced in the recent horizontal increase in railroad rates of about 25 per cent.

Frederick Manley Ives, counsel for the Edison company, addressed the commission during the hearing upon the recognition by other regulative tribunals of the desirability of postponing rate investigations of an exhaustive character during present war conditions.

Granville S. MacFarland, counsel for the petitioners for a rate inquiry, took issue with the company's contention that the present is not a proper time in which to carry through a rate investigation of the scope proposed. The commission took the matter under advisement.

MISSOURI UTILITIES GO BEFORE STATE COMMISSION

Resolution Recounting Present Difficult Conditions
Presented by Eighty Representatives of
Public Service Properties

About eighty representatives of Missouri public utilities presented to the Public Service Commission at Jefferson City on June 10 a resolution which was prepared at the convention of the Missouri Association of Public Utilities at St. Joseph on May 17 and 18. It said that the commission should recognize as fair the operating ratios which existed before the war.

Those who addressed the commission and the utility men were Colonel P. J. Kealy, Kansas City; J. H. Van Brunt, St. Joseph; H. Spochrer, St. Louis, and E. C. Deal, Springfield.

PLEA MADE FOR HIGHER RATES IN INDIANAPOLIS

Testimony Begun on Petition of the Two Companies
for Authority to Add a War Surcharge
to Their Energy Prices

A surcharge of 1 cent or $1\frac{1}{2}$ cents a kilowatt-hour on all electric energy furnished in Indianapolis may be asked by the Merchants' Heat & Light Company, which began the presentation of evidence June 17 before the Indiana Public Service Commission on its petition for authority to make a surcharge.

J. W. Fesler appeared as attorney for the Merchants' Heat & Light Company, and Charles N. Thompson and Elmer E. Scott as attorneys for the Indianapolis Light & Heat Company. Samuel Ashy and Thomas D. Stevenson entered appearances for the city of Indianapolis.

The attorneys for the city filed an answer to the petition in which they said that the petitioners "are not entitled to make a normal profit in these abnormal times, and that they should be required to stand their full share of the burden of the war, without transferring the same to their patrons through increased rates."

Mr. Fesler expressed the opinion that without any surcharge whatever, and with an estimated increase of $6\frac{1}{2}$ per cent in the volume of the company's business, and counting the increased cost of coal and other items at operation, the deficit of the company would reach \$677,000 next year.

The Indianapolis Light & Heat Company introduced a brief to support its contention that it should be granted a new surcharge, which would more than recompense it for the financial loss when its present authorized surcharge of 5 mills for each kilowatt-hour of energy consumed becomes ineffective following June 30. Under the existing surcharge, \$214,238 additional revenue above pre-war rates had been made possible during the year ending June 30, 1918, two months being estimated. Of this electric consumers paid \$194,382, and steam heating, \$19,855.

While gross operating revenue increased over the corresponding period last year, there has been no increase in the average price per kilowatt-hour sold, and there have been heavy increases in costs of operation and in fixed charges. In addition, the requirements for extensions, additions and betterments to take care of the increased demands during the past year have required the company to spend \$1.92 for each dollar of increased revenue received.

The increasing price of coal, which cost \$2.945 a ton during the two months ended June 1, 1918, was discussed, and then the company declared that the operation of Indiana's new prohibition law decreased its revenues annually approximately \$26,000 a year. This estimate was based on the loss of business in April.

At the hearing on Wednesday it became apparent that the commission intends to authorize an increase in electric power rates, especially a higher rate for large consumers, in proportion to the increased cost of coal, labor and materials.

This outlook developed when calculations by the commission and the witnesses for the Merchants' Heat & Light Company showed that the switchboard cost per kilowatt-hour for the year ending June 30, 1918, would be 9.71 mills, without allowing for cost of distribution or interest on investment, or about 1 mill more than

some of the large consumers would pay on the rates before the surcharge of 5 mills was authorized by the commission last year.

The surcharge of 5 mills authorized last year applied to all energy except that used in homes. The companies are asking for a new surcharge on residential as well as commercial energy.

BANKERS INVESTIGATING PUBLIC UTILITY RELIEF

Committee of Four Named in New York at Suggestion of Governor Harding of Federal Reserve Board—\$100,000,000 Plan

At the suggestion of W. P. G. Harding, governor of the Federal Reserve Board and managing director of the War Finance Corporation, a committee of four New York bankers has been formed to investigate financial needs of public utilities with the object of preparing a plan by which capital may be furnished for them. The committee is: James N. Wallace, president Central Union Trust Company; Charles H. Sabin, president Guaranty Trust Company; Thomas W. Lamont of J. P. Morgan & Company; Frederick Strauss of J. & W. Seligman & Company.

The committee is considering the organization of a corporation with \$100,000,000 capital. This corporation would purchase utility securities, and its notes would be discounted by the War Finance Corporation. Bankers throughout the country would subscribe to the stock. This would distribute the risk and also serve to encourage active co-operation from all sections. Adoption of this plan would do away with the necessity of amending Section 7 of the War Finance Corporation law.

The War Finance Corporation announced on June 19 that it would loan directly to the Brooklyn Rapid Transit Company \$17,320,000. The advance is based on a plan requiring holders of the company's notes due on July 1 to exchange not less than 70 per cent of the face amount of the notes for new three-year 7 per cent notes of the company.

MANUFACTURERS ALERT TO THE STEEL SITUATION

Control of Distribution of All Manufactured Steel Products and Pig Iron Touches the Electrical Manufacturers

Control by the War Industries Board of the distribution of all manufactured steel products and pig iron touches directly the question of operation of electrical manufacturing industries during the war. The electrical manufacturing industries are doing a large amount of work directly or indirectly for the government. More and more they are converting their output to essential products.

Manufacturers are now studying their manufacturing processes with great care so as to conserve raw materials, and especially those in which shortage exists or threatens. They are also studying their business in order to determine definitely what is essential war production and what belongs to the less essential classes.

Great War Savings Stamp Drive in Indianapolis

The \$5,000,000 war savings stamp drive in Indianapolis and Marion County was inaugurated by Theodore Roosevelt before 15,000 people on June 11. The largest cash register in the world was erected by the side of the office building of the Merchants' Heat & Light Company, the busiest corner in Indianapolis.

MORE EFFICIENCY IN STEAM-PLANT OPERATIONS

Papers Presented by Eskil Berg and D. W. R. Morgan Before Joint Meeting of Engineering Societies in Chicago

"The Advantages of High Pressure and Superheat as Affecting Steam-Plant Efficiency," by Eskil Berg of the General Electric Company, and "Condensers," by D. W. R. Morgan, engineer condenser department Westinghouse Electric & Manufacturing Company, were the topics of papers presented before a joint meeting of the Chicago Section, American Institute of Electrical Engineers, the electrical section and mechanical section of the Western Society of Engineers and the Chicago Section of the American Society of Mechanical Engineers at Chicago on June 17.

Mr. Berg strongly favored the adoption of higher pressures and higher temperatures than are now considered standard in this country in order to improve plant efficiency. He especially favored higher pressure. His paper was replete with data showing the possible saving in fuel which can be made through these processes. As indicative of the character of these data, Mr. Berg presented a table showing that a plant operating with 800 lb. boiler pressure and 800 deg. superheat, containing turbines 85 per cent efficient and boilers 88 per cent efficient, could produce 1 kw.-hr. on 11,750 B.t.u.

Mr. Morgan described the improvements in the art of condenser building which have been made by the Westinghouse company. He also predicted that the war would probably make it necessary for central stations to use more jet condensers and to use steel tubes or tubes of other than bronze metal in surface condensers in order to conserve for actual war uses metals more sorely needed.

In the discussion, Harold Almert, consulting engineer, who has been appointed by the State Council of De-

fense to see that coal is burned economically in Cook County, stated that Chicago and the remainder of Cook County alone consumed 33,000,000 tons of coal annually. He expects to make a 10 per cent saving on this consumption by asking increased diligence in the larger plants and taking such steps as are necessary to guarantee better efficiency in the 90,000 small plants operating in the district.

The remainder of the discussion was largely confined to questions which were answered by Mr. Morgan and Mr. Berg. Among those who took part in the discussion were C. V. Kerr, M. J. Kermer, A. D. Bailey, F. R. Wheeler and Mr. Heald.

Answering a question on the cost of high-temperature and high-pressure equipment, Mr. Berg expressed the opinion that after development charges have been eliminated this equipment will be cheaper than that now produced for standard pressures and temperatures.

Mr. Morgan in his closing remarks urged attempts to go from 28 in. to 29 in. (71 cm. to 73 cm.) of vacuum, thus effecting a saving of 4 per cent.

WASTEFUL USE OF ELECTRICITY MUST STOP, SAYS DR. GARFIELD

Complaints Have Been Made that Excessive Illumination Still Prevails and that Signs Are Sometimes Lighted in the Daytime

Fuel Administrator Garfield warns the public against prodigal and unnecessary use of electricity for outdoor advertising purposes and other display illumination.

Reports made to the Fuel Administration by state and county administrators and letters received from individual observers are to the effect that owners of theaters and other establishments frequently turn on their display signs and outdoor lights during the daylight hours and that both municipalities and individuals have returned to the habit of excessive illumination.

The Fuel Administrator said this waste must be stopped. Unless official reports show that display illuminations are kept within reasonable bounds and are limited to the hours of darkness, the suspension of the so-called "lightless night" order will be revoked and even more stringent restrictions will be ordered against all forms of outdoor lighting and display illumination.

IN PAST wars victory was thought largely a matter of purely military strategy. Under our highly organized system of to-day the whole weight of the nation must back up with its full resources military and naval action. . . . We are building ships not alone for the war but for the future of world trade. . . . The building of ships, the mining and distribution of coal, the production and conservation of food products and other important war necessities are all vital to the nation's needs during these trying times. We may make mistakes, but we are moving forward and getting results. If each of you will do your part, putting your country above everything else, we will win.—Edward N. Hurley, before the National Coal Association.

PROGRESSING TOWARD THE RECONSTRUCTION COMMISSION

Plan for Such an Agency to Prepare for Vital After-the-War Problems Is Under Consideration in Washington

Following the presentation in the *ELECTRICAL WORLD* of a concrete plan for a proposed Readjustment and Reconstruction Commission, to be appointed now by the President of the United States, to deal now with problems which will be presented to American industry after the war, it has become known in Washington administrative circles unofficially that a plan for a readjustment and reconstruction agency is under consideration.

The Council of National Defense has been studying the subject for a long period, with a view to co-ordinating various government activities in Washington which have had readjustment and reconstruction for their object. When President Wilson recently set up the War Industries Board, under the chairmanship of Bernard M. Baruch, as a separate agency, divorcing it from the Council of National Defense, the latter organization was left with but little work to do. There is reason for the belief that the Council of National Defense has resolved to undertake the work of readjustment and reconstruction, if permitted to do so by President Wilson, and there is also reason for the belief that the President will assent, under the urging of Secretary of War Baker, chairman of the council, acting in behalf of himself and the other five members of President Wilson's cabinet who compose the Council of National Defense.

In Washington official circles there is an impression that this would be logical inasmuch as a number of cabinet officials have begun making public details of readjustment and reconstruction ideals upon which their departments and bureaus have been at work, and there is ground in Washington for the strong belief that if the Council of National Defense is authorized by the President to begin work on readjustment and reconstruction problems, W. S. Gifford, director of the council, will not only set to work at once to co-ordinate all the work in the various departments but will undoubtedly call into consultation and activity at Washington men in private industry.

The subject is now being discussed in Washington, and letters and telegrams are being received urging the creation of such an agency at once.

Philip H. Gadsden, chairman of the National Committee on Public Utility Conditions, strongly indorses the idea of action, saying:

"The great lesson which this war has impressed upon every one is the efficiency resulting from great concentration of capital and labor. The benefits derived by the nation for war purposes in the mobilization of practically all the industries of the country will not be lost sight of when peace comes. To deal properly with such a radical change in our economic policy will call for all the wisdom at our command. Nothing could aid so much in the proper solution of such a problem as a thorough and comprehensive study of it in advance, such as you suggest."

From the Permutit Company, engaged in water rectification and general sanitation, New York, comes this letter, signed by Samuel Robert, president:

"As we see it, there can hardly be room for doubt

as to both the usefulness, and, indeed, the necessity, for work of the nature referred to, and that this work should be done as quickly and as thoroughly as possible.

"We can think of no better way to prepare the groundwork essential to the proper accomplishment of this vital project (vital to the future benefit of the industries of this great country) than by having a commission appointed as quickly as possible for the express purpose of investigating the necessary steps to prepare for its accomplishment."

Charles F. Lang, president of the Lakewood Engineering Company, Cleveland, Ohio, writes:

"While our company is working night and day on war service for the government, and is constantly endeavoring to expand its usefulness in this direction, all our planning is being done with a view to world-trade conditions after the war, for we feel that we but dimly realize the demands which world trade will make upon American manufacturers in the reconstruction period immediately following the war.

"And we also recognize the period of tremendous readjustment which must take place in our own country. National conditions and national ideals are entering a violent revolution rather than a slow evolution, and I sincerely trust that the very constructive program suggested by you will receive serious consideration and prompt action on the part of the government; for the problems involved are not merely national, but world problems, and individual thinking by individual business men is hopeless—the nation must think and plan as a nation."

From the great merchandising house of William Filene Sons Company, Boston, this letter, signed by Edward A. Filene, its president, who is chairman of the war shipping committee of the Chamber of Commerce of the United States, has been received:

"If the bulk of the reconstruction planning is left to separate classes and interests, we shall come to the end of the war with a series of reconstruction programs. Business will have a program; labor will have a program; agricultural interests will have a program; banking interests will have a program; socialists and holders of related theories will have a program. And at the very moment when unity of purpose and promptness of action will be vital to the welfare of the country we shall be obliged to pay the price of costly delay incident to the harmonizing of these several programs.

"It is clearly the wise policy to create a government commission so thoroughly representative of all classes and interests that it will command the support of all classes and interests. If such a commission collates its facts, formulates its conclusions, and submits them in advance to the most exhaustive criticism from all possible angles, we shall be able to get most of the work of compromise out of the way by the end of the war and arrive at the time of action with a unity of purpose and policy otherwise impossible.

"I realize the question of tactics and timeliness involved in any proposal to-day not related to the immediate job of prosecuting the war; and yet the war will end some day, and whether that time be one year or twenty years from now, the time will be none too long for the analysis of the complicated problems that underlie the return of our social, industrial and political life from a war basis."

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

A. I. and S. E. E., Philadelphia Section.—On June 15 the Philadelphia Section of the Association of Iron and Steel Electrical Engineers held its annual outing at Valley Forge with sight-seeing and athletic sports.

Electrical League of Cleveland.—H. L. Schneider was elected president, Mathias Turner vice-president, George S. Crane treasurer and L. J. Darrah secretary at the meeting of the board of directors of the Electrical League of Cleveland on June 10.

A. I. and S. E. E., Pittsburgh Section.—H. L. Uhlend, power and mining engineering department of the General Electric Company, will read a paper on "Electric Welding" before the regular meeting of the Pittsburgh Section of the Association of Iron and Steel Electrical Engineers at the Hotel Chatham to-day (June 22). The paper will deal with electric welding opportunities.

British Columbia Association of Electrical Contractors and Dealers.—On June 4 the British Columbia Association of Electrical Contractors and Dealers held a regular monthly meeting in Vancouver, B. C. President C. E. E. Williams was in the chair. Capt. W. J. Conway of Vancouver was made secretary-treasurer. The next annual meeting will be held in Victoria about the middle of August.

New York Jovian League.—At the annual outing of the New York Jovian League at the Hotel Shelburne, Brighton Beach, it was shown that a good time could be had and a good dinner enjoyed without going against the wishes of the Food Administration. When the rejuvenation was held four men were initiated by First Tribune G. V. W. Piez. Among the entertainment features were the "review" and dancing.

American Society for Testing Materials.—The twenty-first annual meeting of the American Society for Testing Materials will be held at Atlantic City, N. J., June 25 to 28, at the Hotel Traymore. Among the important items on the program are the report of the committee on magnetic properties of steel, C. W. Burrows chairman; topical discussion on "Co-operation in Industrial Research"; report of committee on lubricants, C. P. Van Gundy chairman; "Internal - Combustion Engineering—Lubrication and Lubricants," by P. H. Conradson; report of committee on refractories, A. V. Bleininger chairman; "The Necessity for Inspection and Testing of Refractory Bricks," by C. E. Nesbitt and M. L. Bell, and the report of committee on electrical insulating materials, C. E. Skinner chairman.

California Co-operative Campaign Gathering.—A "get-together" dinner under the auspices of the California Electrical Co-operative Campaign was held in San Francisco on June 7. John A. Britton, vice-president and general manager Pacific Gas & Electric Company, acted as toastmaster. Other speakers were L. H. Newbert, chairman of the advisory committee of the California Electrical Co-operative Campaign and manager of the commercial department Pacific Gas & Electric Company; H. C. Reid, president California Association of Electrical Contractors and Dealers; Samuel Kahn, president Pacific Coast Section of the National Electric Light Association; Frank R. Devlin, member California Railroad Commission; A. B. C. Dohrmann, president Dohrmann Commercial Company; S. M. Kennedy, general agent Southern California Edison Company, and Albert H. Elliott, secretary Pacific Division Electrical Supply Jobbers' Association.

New York State Association of Electrical Contractors and Dealers.—The first annual meeting of the New York State Association of Electrical Contractors and Dealers is to be held at the Grand Union Hotel, Saratoga Springs, N. Y., on June 24 and 25. Among the important papers to be presented are "The Scientific Adjustment of the Weight Scale," by L. K. Comstock; "The Responsibilities of the Electrical Press," by O. H. Caldwell, editor of *Electrical Merchandising*; "The Part of the Central Station in the Goodwin Plan," by Alexander Anderson; "The Jobber," by C. R. Russell of the Esco Electric Supply Company, Albany, N. Y.; "The Manufacturer," by J. Nelson Shreve of the Habirshaw Electric Cable Company; "Accounting Costs and Overhead," by Messrs. Coles and Watters of the Lord Electric Company, and "The Advantages of Separate Cost Planning of Different Departments," by F. A. Mott of the Wheeler-Green company, Rochester.

A. I. E. E., Detroit-Ann Arbor Section.—At the regular annual meeting of the Detroit-Ann Arbor Section of the American Institute of Electrical Engineers W. A. Hirt, production department of the Detroit Edison Company, spoke on "Plotting for Economy." The main feature of the paper was the presentation of a method based upon elementary calculus for determining maximum efficiency of a combination of power generating units for any range of load. The deductions from analyses of input-output or so-called characteristic curves are interesting from the operating engineer's viewpoint, and it seems probable that the knowledge gained will be utilized in future design. Although the deductions made in the paper are based upon mathematical analyses and the use of graphs, the treatment of the subject has been with special regard to the necessities of daily plant operation. Empiric methods are touched upon, showing application of this method by a combination of the use of arithmetic and simple drafting methods.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Scope of Employee's Duties.—It was outside the scope of the duty of a yardmaster of a coal company in admitting an employee of a light company to inspect a meter to engage in a dispute with him relative to the demerits of their respective employers in the course of which he was provoked into killing the inspector, and on these facts appearing in an action brought against the coal company for damages because of the murder, the coal company was entitled to a peremptory instruction, according to the Supreme Court of Tennessee (202 S. W. 935).

Contributory Negligence.—Where plaintiff's intestate, while climbing a pole to remove a wire for his employer, came into contact with defendant's defectively insulated high-voltage wire, which passed about eight inches from the pole, and was killed, the fact that deceased was not wearing rubber gloves, as required by his employer, when within reach of live wires, does not constitute contributory negligence as a matter of law, according to the New York Supreme Court in *Bell versus General Electric Company* (170 N. Y. S. 170). Where decedent's death was caused by coming in contact with defendant's defectively insulated high-voltage wire while climbing a telephone pole for his employer and it was not proved that he grasped the wire, but from his injuries it appeared that he fell upon the wire, contributory negligence was for the jury.

Jurisdiction of Appeal from Commissioner's Decision.—On an appeal to the Circuit Court from an order of the State Public Utilities Commission authorizing a change of telephone rates, where the chairman of the commission, being present in court, refused to file a transcript of the proceedings, the court had jurisdiction of his person, and could punish him for contempt, the Supreme Court of Illinois held (119 N. E. 423). Where the commission has entered an order authorizing a telephone company to change its rates and the city has appealed therefrom, jurisdiction is conferred on the Circuit Court under direct statutory provision to hear and determine the matter of the appeal, when a copy of the notice of appeal, with proof of service, is filed with the clerk. In an appeal from an order of the commission authorizing a telephone company to change its rates the transcript of the commission is essential under the law, provided that no new or additional evidence be introduced in any proceeding on appeal from any decision or order of the commission, but that the appeal is heard on the record thereof.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Coal Cost and Rates.—In allowing the Seymour Electric Company to increase rates the Wisconsin Railroad Commission held that analysis of operating performance indicated average efficiency as regards coal consumption, that the mechanical efficiency of the utility's plant did not differ materially from other small plants in the State, and that the allowance made for labor was sufficient to provide for continuous operation as desired by the city, though should the fuel and labor situation become worse curtailment of hours of service may become necessary.

Return from Energy Sales Found Inadequate.—Deciding that the Cross Plains Electric Company should have authority to raise rates, the Wisconsin Railroad Commission held that analysis of the earnings and expenses indicates that for the year ended June 30, 1917, the company failed to earn more than 5.3 per cent on its estimated value, and that the elimination of receipts from sale of fixtures, wiring, etc., would wipe out entirely the surplus available for returns during such year. The company declared that it was losing money on farm consumers owing to transformer losses, that the greater proportion of its profits came from house wiring and sale of fixtures, a business it was no longer engaged in, and, in general, that it was losing money because its lighting and power rates were too low in proportion to the cost of doing business.

Communities Served from One System.—Approving new rates for the Wisconsin Gas & Electric Company at Union Grove, the Wisconsin Railroad Commission said in part: "The principal contention of those consumers who complained of the rates in effect for residence and commercial service was that in Corliss, a much smaller place than Union Grove, electric consumers received service from the respondent company at lower rates than those in the latter community. In regard to the practice in vogue in many parts of the State of serving all communities tied in on one transmission system at the same rates, it is apparent that unless the original rate schedules are carefully determined, the expense of serving certain communities will be borne in part by one or more of the others. If the rates in effect in Corliss are equitable for that community, then the same rates will not be sufficient to cover the operating expenses including fixed charges on delivering energy to Union Grove. At the hearing the company proposed certain rates for residence and commercial lighting service. Inasmuch as the proposed rates offer considerable reductions for even the average use of en-

ergy, we believe that they should be put into effect and given a trial."

Rate Increases in Illinois.—In an order effective from May 1 the Public Service Commission of Illinois has granted almost in its entirety the petition of the Illinois Traction System for emergency relief for electric railway, electric light and gas companies in fourteen Illinois cities. The commission allows 6-cent fares in Cairo and Jacksonville, elimination of tickets and straight 5-cent fares in Bloomington, Decatur, Danville, Champaign, Urbana, Galesburg and Quincy. Increases in rates for gas ranging from 10 to 25 cents per 1000 cu. ft. are allowed in Decatur, Danville, Champaign, Urbana, Galesburg and Jacksonville. Electric increases of approximately 1 cent a kilowatt-hour are allowed in Bloomington, Galesburg, Normal, Decatur, Danville and Jacksonville, while smaller increases are allowed in Cairo and cities in which the Madison County Light & Power Company operates. The order in brief says that this is an emergency case, and that it is the duty of the commission in each case to determine what may be reasonable rates for public and utility alike. The new rates are not to remain in effect beyond six months after the termination of the war and may be rescinded before that time if the commission decrees.

War Necessities.—In its recent decision allowing 10 per cent increase in various rates of the Philadelphia Electric Company the Pennsylvania Public Service Commission said in part: "The testimony shows that the companies interested have entered upon a very large construction and extension program designed to meet the extraordinary demand for energy which has arisen in this district during the last year and a half and particularly since the declaration of war. The district served by these companies, especially by the Delaware County Electric Company, contains an unusually large number of new plants, the maximum operation of which is absolutely essential to the welfare of the country. These plants and the population dependent on them are relying upon the applicant companies for a continuous and adequate supply of energy, and it seems to this commission that its first duty is to assure the production of this energy upon terms which are reasonable to all who are concerned in it. We are convinced, however, of the necessity for increasing the rates to the extent of 20 per cent and are of the opinion that an increase of 10 per cent for the services in question will be sufficient to accomplish the ends which we have outlined above. There can be little doubt that the sales of the companies will be greatly increased during the coming year, and that certain economies in operation will be effected by the installation of the improvements which are being made. These facts, together with the 10 per cent increase we are authorizing, should assure the companies of an income sufficient to meet the increased operating expenses and leave a fair return upon the property."

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Failure of Car Supply for Coal.—The Eastern Utilities Coal Company calls attention to the continued failure of coal transportation, as evidenced by conditions at its properties. The normal car supply should be at the rate of 266 cars per month, and at no time during the past seven months has the supply been 50 per cent. The actual record is as follows: November, 129 cars; December, 80 cars; January, 52 cars; February, 70 cars; March, 101 cars; April, 118 cars; May, 124 cars.

Milwaukee Wants to Increase Its Street Lighting.—An appeal will be made to the Capital Issues Committee of the Federal Reserve Board at Washington to permit the city of Milwaukee to go ahead with its municipal lighting distribution proposition. At a recent meeting of the council Alderman William I. Green said that the \$250,000 approved by the committee was not sufficient to carry on the work, and he introduced a resolution asking the board to permit the entire bond issue of \$500,000 to go through.

Work of Naval Consulting Board.—The Naval Consulting Board, which was created nearly three years ago, when Secretary Daniels invited Thomas A. Edison and eleven leading technical societies to nominate representatives who should constitute it, thus concentrating for service the engineering and inventive talent of the country, has up to date acted upon more than 65,000 inventions of all kinds. A special board to consider inventions for army use has recently been created, known as the inventions section of the General Staff.

Summer Courses in Electrical Engineering.—The College of the City of New York is offering at a nominal fee as part of its summer session courses in elementary electrical engineering, telegraphy and telephony. The purpose of the first course is to give a clear idea of the main underlying principles and methods of electrical engineering, the methods of constructing, installing, operating and maintaining motors and generators of various types and certain other of the simpler forms of electrical apparatus. The courses in telegraphy and telephony appeal to men seeking positions or advancement with telegraph and telephone companies and are given in co-operation with the Western Union Telegraph Company, the Western Electric Company, the New York Telephone Company, the American Telephone & Telegraph Company, the Kellogg Switchboard & Supply Company and the Automatic Electric Company. Prof. Paul Klapper is the director of the summer session of the college.

Otto J. Hawley, assistant chief engineer of the Public Service Company of Oklahoma, has resigned to go to San Francisco.

Max Thelen has resigned as chairman of the California Railroad Commission to become surveyor of contracts for the War Department at Washington.

L. V. Purtne, who was formerly chief engineer of the Public Service Company of Oklahoma at Tulsa, has been transferred to the Dallas office of the American Public Service Company.

Edward Lane, who was formerly connected with the Des Moines City Railway Company, is now in charge of the power plant of the Kansas City (Mo.) Electric Light & Power Company.

Frank E. Hanchette, who has been with the Edison Electric Illuminating Company of Brooklyn for the past six and a half years as chief electrical inspector in the operating department, has resigned and will devote his energies to the marine field under the government shipbuilding program, a line in which he has had a broad experience.

Frank Espy, former assistant to the general manager of the American Gas & Electric Company, New York, has succeeded Hugh Montgomery as general manager of the Atlantic City Electric Company. Mr. Espy was formerly general manager of the Ohio Light & Power Company, Newark, Ohio. Mr. Montgomery has been transferred to the New York office.

Charles F. Howe, consulting engineer of Macon, Ga., who has been for many years identified with the water-power development in Georgia, has been commissioned as major in charge of the public utilities at Camp McClellan, near Anniston, Ala. Major Howe was one of the first to recognize the importance of hydroelectric power to the industries of the South and was the originator of what is now known as the Central Georgia Power Company. This company has a large development on the Ocmulgee River midway between Atlanta and Macon. He was its chief engineer during the period of construction and for a number of years thereafter, and is now largely interested in other water-power developments in this and other states.

Leon C. White has been promoted from superintendent of the electric light and power department of the Twin State Gas & Electric Company, Brattleboro, Vt., to superintendent of operation of all departments in the company. Mr. White was born in Brattleboro in 1880 and received his education at the local high school and correspondence school. He first engaged in the electrical contracting business, entering the employ of the Brattleboro Gas Light Company as chief electrician in 1903. When this company was purchased by the Twin State Gas & Electric Company in 1906 he was appointed superintendent of the electric light department, which position he occupied until he was recently placed in charge of the electric, gas and street railway departments of the company.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

William J. Hammer, consulting electrical engineer, New York City, has received the commission of major in the National Army and is stationed at the War College, Washington, D. C., in the inventions section of the war plans division of the General Staff. Major Hammer has been a consulting electrical engineer since 1889. He is a fellow and past-president of the American Institute of Electrical Engineers and has affiliations with a number of other societies.

Henry I. Harriman, president of the New England Power Company, has been re-elected president of the Boston Chamber of Commerce. Mr. Harriman's work for the chamber has been greatly appreciated during the past year, and he undertook it at considerable personal inconvenience in view of the administrative problems brought to his desk as the chief executive of the largest hydroelectric system in the Northeastern States. As it is exceptional for the head of the chamber to hold office for two successive terms, Mr. Harriman's re-election is to be regarded as high evidence of appreciation for the service rendered by him in this capacity. He has worked in close co-operation with James J. Storrow, New England Fuel Administrator, and with the executives of other public utility organizations which are doing much to conserve fuel and meet the pressing difficulties of power supply under present severe conditions. As recently stated in the *ELECTRICAL WORLD*, Mr. Harriman's partner, Malcolm G. Chase of Providence, R. I., has lately taken office as Federal Fuel Administrator for Rhode Island.

Obituary

Charles R. McKay, consulting engineer for the Union Gas & Electric Company, Cincinnati, Ohio, was instantly killed on May 14 in an automobile accident near Cincinnati. Mr. McKay was graduated from Johns Hopkins University, Baltimore, in 1893. He was first engaged as construction engineer for the Pioneer Power Company of Utah and for the Ontario & Daly Silver Mining Company of Utah. During the time he was thus engaged he also served as a member of the Board of Electrical Award of the Chicago World's Fair. He came East as superintendent of the Sprague Electric Elevator Company and later became chief engineer of the Sprague Electric Company. In 1900 he went to Cincinnati as district engineer for the General Electric Company, remaining until 1907, when he became manager of the

electrical and gas departments of the Toledo Railways & Light Company. Two years later he became manager of the Union Light, Heat & Power Company at Covington, Ky., and on the consolidation of this company and the Union Gas & Electric Company of Cincinnati he became manager of the lighting department and chief engineer of the parent company. About a year ago he resigned to devote his entire time to the duties of chief electrical engineer of the construction of the new power plant in Cincinnati. In 1908 he was elected president of the Ohio Electric Light Association, and at one time he was chairman of the Toledo Section of the American Institute of Electrical Engineers.

William Johnson Jenks, electrical engineer and a recognized leader among patent experts in this country, died at West Bridgewater, Mass., at the age of sixty-five, on June 1, after an illness extending over several years. Mr. Jenks was one of the organizers of the library of the A. I. E. E., which now forms a part of the library of the United Engineering Societies, and served for many years on the library committee. He was educated at Pierce Academy, Middleboro, Mass., and began his business career as a newspaper reporter on the *Brockton Advance*. He became a telegraph operator in 1872, from which date he was continuously engaged in electrical work. From 1878 to 1883 he developed and managed at Brockton one of the early telephone exchanges. From 1883 to 1885 he was associated with the Edison Electric Illuminating Company of Brockton as manager. This Brockton plant was the pioneer Edison three-wire underground installation in the history of the electric lighting art. In July, 1885, he accepted the position of manager of the incandescent department of the American Electric Manufacturing Company, with headquarters at New York City, and in October of that year started the first Edison "municipal" system for the lighting of streets by incandescent lamps and Edison dynamos of 1000 volts to 1200 volts at Portland, Me. This was in many respects a new departure in electric lighting. In the summer of 1886 he was engaged by the Edison Electric Light Company as manager of its municipal department, and in the course of the succeeding three years he gave considerable attention to working out the details of this system of high-tension incandescent street lighting. He was also appointed director of the standardizing bureau of the Edison company, and in that capacity assisted in perfecting the methods of distribution and the apparatus manufactured and sold by the Edison factories. From about Sept. 1, 1889, until his last illness he gave practically his entire time to the patent litigation carried on by the Edison Electric Light Company, the General Electric Company and associated electrical patent interests. In addition to his membership in the American Institute of Electrical Engineers he was connected with many other of the engineering and scientific societies.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

CHANGES MADE IN HOSKINS HEATING APPLIANCE SCHEDULE

The Best Discounts That Are Enjoyed by Any Particular Class of Trade Are Given to the Federal Government

A number of changes in the Hoskins schedule on domestic electric heating devices go into effect on July 15. The changes in price are mostly increases, although a decrease from \$7.50 to \$6 goes into effect on 3½-lb. to 6½-lb. plain base multiple-heat irons.

The misunderstanding that has arisen so many times regarding vertical toasters has been cleared up so that those without rack will list at \$5 while those with rack will list at \$5.50. Grills advance from 50 cents to a dollar, according to type. Radiant radiators advance on the 660 watts or less sizes from \$7.50 to \$8.50.

Provisions are made in the new schedule for maximum discounts to the government on all appliances. Formerly the government enjoyed a smaller discount than the central stations. Now, however, where the material is billed direct to the government the discount is 42, 3, 2, 2 net, on appliances, and 25, 10, 10, 5 and 2 net on ranges.

Provision also is made under the new schedule for allowances on returned merchandise. A manufacturer after July 15 may take an obsolete appliance of his own make, sold prior to Oct. 15, 1915, in exchange, provided that it is taken in exchange for a device which has at the time superseded the one returned and that he makes an allowance for the returned device not greater than 10 per cent discount from the net price at which the new device taken in exchange is sold to that particular customer. It is further provided that no advertising or other intensive selling campaign shall be based on this exchange proposition.

A paragraph is added explaining the position of a holding company and how it can operate under the schedule.

RESTRICTIONS TO BE PLACED ON JOBBERS' STEEL STOCKS

As a Result of Conference with War Industries Board Jobbers Will Make Regular Monthly Reports

To what extent jobbers' stocks should be protected by the government has been receiving the attention of the War Industries Board. It is well known that jobbers, particularly those engaged in the electric supplies business, have depleted their stocks repeatedly on government orders without being able to obtain priorities for replenishment.

A meeting to discuss this situation was held on June 13 in Washington by the War Industries Board, which hardware, machinery, pipe and affiliated jobbers were invited to attend. As a result a committee probably will be appointed to supervise and apportion steel for jobbers' stocks.

After the meeting on June 13 the War Industries Board authorized the following:

"Representatives of the board have been in conference this afternoon with representatives of jobbers in hardware, machinery and kindred lines. Fifty or more men from all branches of the trade were present, representing all the large organizations in the trade, large individual concerns and some affiliated lines. The trade pledged full and hearty co-operation with whatever the board might request. Specific suggestions were volunteered by the trade for directing the flow of stocks into essential uses.

"Special consideration was given to the subject of organizing a small committee to represent all branches of the trade and all sections of the country and to sit in conference with the Priorities Committee, the Director of Steel Supply and other officials of the War Industries Board needing its advice or assistance in apportioning steel to hardware jobbers or in maintaining, increasing or reducing dealers' stocks. This plan was favorably received, and it seems probable that it will be put into effect by the industry as a whole.

"A form for monthly reports by jobbers of the quantities sold of the several classes of goods handled was placed before the meeting by the Director of Steel Supply, together with another form on which should be reported orders placed with mills during the same period. The jobbers will undertake to know accurately the uses to which goods distributed by them are to be put and to discourage the undertaking of work not immediately essential, the postponement of which will help to relieve the non-war demands for iron and steel. It is anticipated that this report system can be put into effect to cover from June 1 on, thus furnishing the Director of Steel Supply and the Priorities Commissioner with monthly figures which will be of material assistance in their work."

EASIER CONDITIONS OF LAMP STOCK CONSIGNMENTS

Certain Producers Working on Quantity Production Basis Are Now Urging Distributors to Increase Local Supply

Ever since the distribution of incandescent lamps has been on a consignment basis manufacturers have worked on the maximum customer turnover basis. With a comfortable stock on hand manufacturing thus kept pace with demands which, except for seasonal variations, were fairly constant.

Two years ago this policy was carried still further, and consignees were not allowed to amass a stock larger than necessary to take care of their immediate requirements. The increased demand and the inability of the producers to meet it so seriously reduced stocks that this measure was resorted to.

Since that time, however, the situation generally has cleared considerably, and as a result the policy of producers in regard to stock limitations has in certain instances had a complete reversal. Some producers now encourage distributors to take as many lamps as they can find storage place for locally. The intention of these producers is to amass as large stocks about the country as is possible.

Evidences are seen of a heavy lamp demand coming this winter, and precautions are now being taken where possible to anticipate this condition with adequate stocks. Furthermore, these producers are imbued with the quantity production idea and believe that the factory must run at its maximum capacity even though a surplus accumulates. This is the way, it is felt, to keep the cost of production down to a minimum.

One concern whose output is an influential factor in the market stated that it had not accumulated any great stocks excepting on standard sizes and types. Surprise was expressed to hear that any factory had a surplus. On miniature and auto lamps the admission was general that the factories are still far behind in filling orders. The government's orders are taking a great deal of the output. Therefore it was impossible to say, if present conditions continue, when they could meet the full requirements of the trade. With these producers no larger stocks or extended time

could or would be given any one. If actual needs can be taken care of and shortages avoided, it is the best that can be done.

In the case of a manufacturer who specializes on standards only, it was ascertained deliveries were behind three and four months. This company works on the two and three months' arrangement. Instead of increasing or distributing a large quantity of lamps it was drawing in or scaling down stocks which were carefully watched and regular reports on this condition insisted upon. This company also stated that while it was increasing its production, which was due to the time of year, one of its plants at least would be shut down the first two weeks in July to overhaul the factory and give the employees a vacation. It was learned that some companies were not able to provide jobbers and dealers with more than a two months' stock of lamps. They had not caught up as yet with the requirements of their trade, consequently no stronger stocks could be furnished.

THE WEEK IN TRADE

EVERYWHERE the demand for electrical supplies is of substantial proportions in spite of the maintenance of prices at the present high levels. The peak, of which so much was heard only recently, the line that few believed would be passed, is being ignored. Advances on not a few lines still continue to be made, and no one seems to know how high the figures will go. It is certain that jobbers whenever possible are accumulating stocks on staples, anticipating heavy sales, if not in the immediate future, at least not far distant.

Conduit conditions are very unsatisfactory. The situation is approaching a very acute stage. Standard sizes are depleted and shipments are overdue. The supply of motor fans, particularly in certain sizes, is undoubtedly short and in the East is causing anxiety. West and South stocks are reported as adequate. In New England the movement of washing machines is active and stocks are getting low. On the Pacific Coast industrial material is in lively demand. The new prices on heating appliances go into effect July 15.

The labor shortage is being severely felt in all parts of the country. In the Pacific Northwest the so-called "work or fight" order is stripping jobbers and dealers of necessary employees. Building operations in the same section, particularly residential, are passing all records. In the South large industrial enterprises, calling for important electrical equipment, are on foot. Collections are fairly good, keeping pace with sales, and outstanding accounts are being considerably reduced.

NEW YORK

An advancing market always brings surprises, and current conditions would seem to be no exception. Stocks are of various sizes on heavy staples. Some jobbers are in an enviable position, and others are wondering what will happen next. For example, in certain lines buying has been of the anticipatory order, and where foresight tempered with judgment was exercised the accumulation of much-needed goods in a few hands is one of the surprises. It is said some large distributors, having a line on the market for salable merchandise, parted with their holdings at what was considered a sacrifice, in order to make a quick turn—to their regret now. Others, looking a little farther, still hold their stocks.

Some further changes in prices are reported. Difficulties of getting goods for future operations are growing more serious. Transportation obstacles prevail to an alarming extent, with the embargoes more frequent and not lifting so frequently. Between Philadelphia and New York and intermediate points delivery delays are very frequent.

Financially the trade is sound. Collections from commer-

cial accounts are quite good. No breach in credit firmness is noticeable.

PORCELAIN.—Shipments are coming in slowly and stocks are rapidly absorbed. Orders on delivery for four weeks from Trenton, N. J., have not yet arrived. The embargoes are more restrictive in this stretch of territory, it is said, than anywhere else.

FANS.—There are evidences locally that the supply of 12-in. and 16-in. fans is scant. One manufacturer is sold up on his output; a second is in bad shape for contract delivery, goods promised in March just coming through. One of the largest fan-distributing firms, particularly in the smaller sizes, will have its output curtailed 40 per cent owing to factory conditions. Some others are just about cleaned out, as material is said to be unobtainable for further production.

INDUSTRIAL LIGHTING FIXTURES.—The demand is brisk and the selling movement active. An advance of about 10 per cent was made within the past month.

HOUSEHOLD SPECIALTIES.—The advance of at least \$1.25 on sewing machines to the trade goes into effect July 1. This means a retail price increase of \$2.

LOCUST PINS.—Within a month or so locust pins have been marked up by \$4 on 100 to 500 lots, and lots of 1000 by a trifle over \$5. There is apparently an ample supply in stock, with the future uncertain.

LINE HARDWARE.—All malleable iron, japanned and galvanized brackets were advanced from 10 to 15 per cent on June 5. Malleable iron brackets are difficult to get.

COVERED WIRE.—Deliveries on No. 14 wire from a nearby plant are delayed weeks at a time and this is said to be affecting selling conditions on this number. No further increase is noted on rubber-covered and weatherproof.

HEATING APPLIANCES.—One of the leading distributors is sending out advisory notices to the trade respecting next winter's expected shortage of fuel and gas. It is therefore self-evident, according to this high authority, that ample stocks of plate warmers, grills and radiators should be provided to meet the anticipated emergency.

COLLECTIONS AND CREDITS.—On government accounts collections are prompt. Commercial bills, nevertheless, are quite good. Credits receive rigorous treatment, and little disposition is shown to be lenient on business suggestions of any risk.

CHICAGO

Another shell plant has been authorized for Chicago by the government. This news is viewed with considerable interest by the local trade, particularly at this time, as it comes simultaneously with a report from the Illinois Manufacturers' Association that 200 small factories have been forced to shut down because of lack of steel. The general situation in steel is occupying a great deal of attention in the trade. The report which J. L. Replogle sent to the steel mills stating that the steel supply committee of the War Industries Board is not concerned about any one getting steel except the plants engaged in government work, in which case priority orders are issued, seems to have covered the situation rather fully. At the present time there is also an undercurrent of agitation on the difficulties of public utility financing. Important bankers in this section are taking an active interest in the situation, and the belief seems to be that some method will be found for permitting utilities to secure relief either by means of increased rates or otherwise. Definite talk about higher traction fares in the city of Chicago is reported daily in the newspapers. Electrical supply jobbers report that business has improved during the last week. There have been practically no changes in prices, although it appears certain that the coming two or three weeks will supply numerous examples of this. While the jobbers are fully aware of this situation, their customers do not appear to be taking advantage of the present opportunity to get in stock before the increases. Telephone companies are the one exception.

CONDUIT.—The jobbers foresee a situation wherein conduit is going to be impossible to get excepting for actual government needs.

FANS.—The spell of hot weather during the last week was not of long enough duration to produce much movement in fans, but no one is despairing of the situation yet. A little hot weather, however, would be welcomed.

SCHEDULE MATERIAL.—While the jobbers were pretty well protected on the recent advance in schedule materials, their customers were not. The old policy of informing all customers in advance of price increases seems to be rapidly dying out among the jobbers.

RESALE GOODS.—Jobbers' stocks of resale merchandise appear to be good, with the exception of washing machines. Manufacturers' deliveries to the jobbers are poor, however, and give promise of being worse.

OFFICE EQUIPMENT.—Such office accessories as telephone brackets, push-buttons for buzzer systems and goods of this class have exceeded the capacity of the factories.

ELECTRIC RANGES.—The total volume of business in electric ranges to date for 1918 is about the same as for the preceding year, with an exceptionally good prospect for exceeding last year's record when all the returns are in.

BOSTON

The volume of trade continues to be maintained at a high level, and thus far there is little evidence of a summer recession. May was a particularly good month for local jobbers. Railroad congestion still hampers deliveries, and until some of the new locomotives and cars ordered by the federal authorities get into service little improvement is anticipated. Central stations are overwhelmed with war work, but are doing almost nothing in the way of commercial expansion unless related to war supplies. Small appliances are in considerable demand, and there is an improvement in the sale of portable lamps within the past fortnight. Collections are fairly good at present and are apparently unaffected by the war savings stamp campaign, an entirely different matter, of course, from the Liberty bond campaign work.

Stocks are understood to be large at present, owing to the vigorous efforts of the jobbers to anticipate demands and keep ahead of the transportation situation. Labor conditions are unsettled at this writing, a strike of electrical workers having been called in the Boston district in direct violation of an agreement to stand by the finding of H. B. Endicott, chairman of the Massachusetts Food Administration. The central stations are maintaining their service without interruption. A 10 per cent increase in the pay of hour and piece workers goes into effect July 1 at the Lynn factories of the General Electric Company. Recent price changes include an advance of 8 per cent in electric loading machines built by the Conant Machine Company, Concord Junction, Mass., and a 10 per cent advance on Century motors.

FARM LIGHTING SETS.—Business is brisk and a larger turnover is expected this year than last. Prices have shown no change since March. Stocks are prepared for prompt shipment. One dealer has two carloads of sets in his basement and three more on the way, while the factory has material enough on hand at this time for the production of 50,000 sets.

FANS.—Cool weather still holds back the flow of fans to the consumer's sockets. Unless a hot spell comes soon this year's business may run below anticipated totals. The psychological effect of a hot wave in late May or early June is much better for fan sales than warm spells in mid-summer. Sales are being made to Chinese laundries, though these were held up for some time by the price increases of this year. Stocks are ample for the present.

WASHING MACHINES.—These are selling very rapidly. One of the largest central stations in New England has sold out its entire stock and is now drawing upon consigned machines.

PORTABLE LAMPS.—A spurt in retail demand has developed within the past fortnight. Practically all the business is renovation work in fixtures. Stocks are very large. Prices are being shaded in some cases to capture summer business, but the results are not as yet very satisfactory.

WIRE AND CABLE.—Stocks are fairly large up to 500,000-circ. mil cable, rubber-covered, with quotations around 32 cents per pound. Weatherproof is quoted around 30 cents. Most of the business is governmental. Little change in prices is quoted.

TRANSFORMERS.—From 10-kw. up stocks are uneven. A 10 per cent advance went into effect June 7 on the leading makes of transformers. Deliveries are being quoted on a three to five months' basis.

ATLANTA

Government requirements and news emanating from Washington are the foreshadowing features in trade this week. The agreement reached between the War Industries Board and the American Iron and Steel Institute virtually places the steel market in the hands of the government. Terms provide that no iron or steel products shall be distributed except in order of urgency as prescribed by the board and after the preferred industries have been served. The out-turn of pig iron recorded for May looks encouraging, being the second largest in the history of the country. The outlook for building operations along normal commercial channels is not so bright, and this class of construction is being further subordinated to more urgent work owing to the scarcity of steel, together with the fact that the government is absorbing about 80 per cent of the cement.

Recent estimates place coal production as falling behind the national demand by approximately 467,000 tons per day. This condition, no doubt, will influence the Fuel Administration to the extent that the long-expected "white list" will be published soon covering essential and so-called non-essential industries. A feeling of uneasiness prevails in this section regarding this measure.

Opinions from men in the electrical industry indicate a still greater demand on hydroelectric companies and a flurry for electric heating appliances such as occurred during last winter. As the East is turning out large quantities of war goods and the freight situation is becoming more serious, it is of considerable interest to note rumors in circulation to the effect that facilities offered by the Southeast will be drawn upon more from now on.

The Doullut & Williams Shipbuilding Company of New Orleans, La., has been organized with a capital of \$1,000,000 for the construction of steel ships. The Consumers' Dye Wood Products Corporation, Mobile, Ala., will erect a plant with a capacity of 1800 bbl. monthly. The Central of Georgia Railway, Macon, Ga., will install a complete electric interlocking signal system. Bertram, Griscom & Company of Philadelphia, bankers, are representing capitalists interested in the Carolina-Tennessee Power Company of Cherokee County, N. C., near the Tennessee line. It is proposed to build a hydroelectric plant on the Hiwassee River developing 60,000 hp. Details are lacking at this time, but preliminary plans call for two dams 150 ft. high thirteen miles apart.

CONDUIT.—The scarcity of conduit is being felt and stocks of ½-in. are badly depleted. A few large shipments for urgent work are long overdue. Although ¾-in. and 1-in. stocks are in better shape, jobbers are exercising considerable caution and scrutinizing all orders carefully.

FANS.—While the movement of fans has been fairly satisfactory, more temperate weather has tended to slow up the feverish demand of last week. The 16-in. is the most popular for general service. Jobbers report substantial sales of ceiling fans to military camps for mess halls and offices. A few jobbers are having railroad troubles and are behind on deliveries of 12-in. and 16-in. sizes.

TEXTILE MOTORS.—Manufacturers state that sales for the first quarter of this year were well above the same period last year and that the volume of business to July 1 will be as good as last year. Better shipments are being promised and excellent deliveries are being made on the four-frame type. Local stocks are in much better shape. This condition is due to improved factory facilities. Business seems to be sustained through the purchase of replacement equipment and individual motors for looms where additions are being made.

SEATTLE

There were no exceptionally large sales or inquiries of importance during the past week and general business conditions continue unaltered. The volume of commercial and domestic sales is well sustained. The volume to the shipyards and industrials shows an increase over the last two weeks and the government buying was a shade heavier. Generally stocks are in a fair condition, although there are shortages reported on some lines, especially in conduit, larger sized lamps and automobile lamps. The latter are practically impossible to obtain. Small motors and larger power apparatus demands are being met. Deliveries from the East are very slow and orders are being placed far in advance. Placing orders in advance holds true in the case of all stocks, accounting for the fair condition of jobbers' stocks. There are slight fluctuations in prices. To-day finds prices steady and at levels reported for a month past.

Labor shortage is affecting all lines seriously. The "work or fight" order is stripping both jobbers and retail houses. It is impossible to obtain warehousemen, male clerks and stenographers. Furthermore, it is believed the order will serve to relieve somewhat the shortage in the shipyards and lumber camps.

Sales to jobbers and dealers are of small consequence. The municipal lighting department of Tacoma will shortly call for bids for furnishing approximately \$20,000 worth of energy-consuming devices, including ranges, water heaters and electric heaters. The number of permits for electrical installations last week shows an increase of considerable proportions over the last three weeks in Seattle and Tacoma. The installation of electric ranges in apartment houses is increasing. Sales of house-wiring devices, including fixtures are increasing over the last two weeks.

The Northwest general contractors predict that the building peak will not be reached until midsummer or early fall. From present indications the summer months will see a volume of residence construction never equalled in the history of the Northwest cities. Constructional activity is not confined to the larger cities, as the smaller towns are building in proportion to the size and needs, which are constantly increasing.

Spruce production in the Olympia peninsula for airplane stock is to be increased by the construction of a mill with a daily capacity of fifty carloads. Initial construction has been started. Credits placed with the new shipyards and allied industrial plants are closely scrutinized. The extension of old credits predominates, but new credits of considerable proportions were placed recently. Collections are satisfactory and keeping pace with sales.

SAN FRANCISCO

Business continues good, though noticeably better in country districts and in the interior cities than in the large coast cities.

New packing plants are being erected in Mountain View and Livingston, Cal., and a new cotton reduction plant in Tucson, Ariz. Counter sales are rather poor. Sales of house-wiring material have picked up slightly. Sales of industrial material are large and of continually increasing quantities, so that constant revision of stock standards is necessary.

Collections are better than they have been this year, not only from dealers, but from industrial plants, which were slower than one might expect during the first few months of the year.

FANS.—The first real hot weather of the year, recorded at 100 deg. through the interior valleys and nearly as high along the coast, has stimulated fan business, which up to this time has not been extraordinarily good. Intensive work by dealers among plants recently erected in their territory will no doubt add to its volume. One San Francisco jobber reports an extremely large order of fans for export to Japan.

HEATING MATERIAL.—Sales of small heating devices are poor, the number of flatirons sold being far less than normal during April, which is usually a good iron month. Sales of other devices are slow, probably because of their comparatively high first cost, due to recent advances, and

the feeling of personal retrenchment engendered by recent war-time demands.

PORCELAIN MATERIAL.—An investigation of stocks and demands for the first few months of this year, compared with the corresponding period of last year, discloses the fact that sales of standard porcelain material, such as split knobs, 3-in. tubes and standard two-wire and three-wire cleats, has fallen off from 50 to 67 per cent owing primarily to the lack of building calling for such wiring. There is very little house building in the country districts, and the factory building specifications are up to date and protective. The government has been doing very little fire-protection construction in the forests this year, and this fact has affected the sale of certain standardized porcelain material.

SCHEDULE MATERIAL.—As before noted, schedule material is advancing in price, because of increased freight rates and increased cost of raw material and labor necessary for assembling it. The latest items to be affected are flush receptacles and parts, which have just advanced 10 per cent for Pacific Coast delivery. Manufacturers who carried Pacific Coast stocks report peculiar demands, especially in the piece parts of separately packed sockets and receptacles, showing that jobbers and dealers are not yet familiar with the possibilities of this plan and are correcting their stocks after a few months' experience under the new condition. This is especially true of brass caps, the demand for which is all out of proportion to the bases.

METAL MARKET SITUATION

Copper Requirements for Wire Manufacturers Hard to Obtain on Commercial Orders

Wire producers are finding it difficult to obtain copper, excepting on priority certificates for direct or indirect war work. The capacity of about every wire plant is largely taken up with government requirements, and when it comes to commercial orders the obstacles in obtaining the basic metal for rubber-covered, cable and weatherproof and other wire products are reported to be trying. Sellers of copper are evidently paying slight attention to civilian demands. Deliveries to seaboard points have not improved. One shipment of five cars of copper took more than five weeks to reach New York from Baltimore.

Copper producers and refiners are scheduled to meet with the War Industries Board again on Aug. 7 to discuss the price situation. They contend that their interests have not received fair treatment in having the official price of 23½ cents a pound reaffirmed until Aug. 15. It is said that if the copper people cannot convince the board of the justness of their claim they may decide it to be advisable to take the matter to the courts for a decision.

Lead is advancing and the demand is strong. An effort is being made to avoid any further rise in prices; otherwise the government may find it necessary to step in and regulate affairs on an equitable basis. Tin is receding in price. The changes in old metals are trifling, with zinc scrap showing a tendency to stiffen a shade on price.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Motor-Driven Meat and Food Chopper

A compact and easily operated motor-driven meat and food chopper has been placed upon the market by the Enterprise Manufacturing Com-

COMPACT MEAT AND FOOD CHOPPER

pany of Philadelphia. The chopper is directly connected to a $\frac{1}{2}$ -hp. universal motor by means of a solid shaft.

Rheostats for Motion-Picture Projection

For use in connection with a 32-volt lighting plant supplying energy for motion-picture machines illuminated by tungsten lamps, the Ward Leonard Electric Company, Mount Vernon, N. Y., has developed a low-resistance current-regulating rheostat. The tungsten lamps used with the motion-picture machines must have exactly 20 amp. flowing through them at all times

AMMETER ATTACHED TO RHEOSTAT INDICATES EXACT AMOUNT OF CURRENT

to insure the highest efficiency and longest life. In order to get this 20 amp. it is necessary to reduce the generator voltage by means of a low-resistance rheostat. The rheostat shown herewith is provided with an ammeter

set at the 20-amp. point so that the operator can easily see that the rheostat's lever is in such a position at all times that the meter will register 20 amp.

The first two steps of the rheostat are of high resistance, which permits the lamp filament to heat up before the full voltage is applied, thus assuring long life to the lamp. This resistance also cuts down the current before the circuit is opened, which is accomplished by the rheostat. The rheostat and the ammeter are placed in series with the source of energy and the lamp.

Low-Tension Dead-Front Switch Panel

Owing to their high factor of safety, the dead-front panel switches manufactured by the General Electric Company of Schenectady, N. Y., are especially valuable in factories where switchboards are operated by inexperienced employees. Primarily, these

FUSES ARE NOT ACCESSIBLE WHEN THE SWITCH IS CLOSED

panels are intended as distributing panels for light and power and for generator and feeder panels for small lighting and power plants.

One switch unit, as shown in the accompanying illustration, consists chiefly of a standard knife switch and fuse-clip parts mounted on a slate base and supported by iron studs at the back of a sheet-steel panel. The operating handle has the same general appearance as an oil circuit-breaker handle and is so arranged that it is in the vertical position when the switch is "on" and at an angle of 60 deg. with the panel when the switch is in the "off" position. The operating link passes through both the steel panel and the slate base and transmits the motion from the handle to a lever attached to the cross-bar of the switch. The steel panel of the switch unit is provided with a sheet-steel door which is hinged at the top, allowing it to open

upward as far as the stop on the operating handle behind which it is mounted. This door gives access to the fuses from the front of the panel but cannot be opened while the switch is "on." When this door is open the switch cannot be closed. Fuses can be inspected or replaced at any time, but the operator cannot come in contact with the live current-carrying parts, as the fuses are on the load side of the switch and the fuse clips must be dead before the fuse compartment door can be opened. The switch can be locked in the "off" position by an ordinary padlock. The capacity of the switches is limited by the sizes of 250-volt and 600-volt inclosed fuses as approved by the National Board of Fire Underwriters. Current ratings range from 60 amp. to 600 amp.

Electrically Heated Faucet That Supplies Hot Water

Hot water can be obtained almost instantaneously by means of an electrically heated faucet that is being manufactured by the Electrical Products Corporation, 6 South Calvert Street, Baltimore, Md. This device, as shown in the accompanying illustration, may be attached to any standard plumbing fixture and is ready for operation when the plug is inserted in an electric socket.

One turn of the faucet handle starts the flow of cold water, and the second

A TURN OF THE FAUCET CONNECTS THE HEATING ELEMENT TO ENERGY SOURCE

turn makes the electrical connection and heats the running water. The manufacturers claim that this device will heat 24 gal. (91 l.) per hour to a temperature between 110 deg. and 180 deg. Fahr. This faucet is adjustable

to any water pressure and can be used on either grounded or ungrounded systems of energy supply.

Crane Protective Panels

Crane panels which are used as distribution centers and also to protect the electrical equipment of the crane from abnormal conditions that may arise from overload, short circuits, grounds, voltage failures, etc., are being manufactured by the Allen Bradley Company, 495 Clinton Street, Milwaukee, Wis.

All electrical distributing and protective apparatus is mounted on one single panel and is centrally located in the crane cab. Undervoltage protection is given as well as double-pole, time-limit, overload protection for the entire equipment grouped together. The installation includes self-closing overload relays. A push-button station is used to reset magnetic clapper switches. Magnetic clapper switch limit stops for hoist in one or both directions are furnished when specified. Magnetic clapper switches for use in connection with dynamic control may also be furnished when specified. The magnetic switches are arranged for non-closing on overload.

Portable Electric Searchlight for Emergency Work

A self-contained portable searchlight operating on its own power and yet light enough in weight to be carried in the hands has been placed upon the market by the Portable Electric Searchlight Company, 87 Haverhill Street, Boston, Mass. An adjustable bracket permits of the rays being pointed in any direction and has a 7½-in. (19-cm.) adjustable-focus, single-shell reflector made with great accuracy. It burns continuously about two and one-half hours before it becomes necessary to recharge it.

It is especially adapted for electric light companies for locating and re-

FOR TEMPORARY ILLUMINATION OF OUT-DOOR SUBSTATIONS

pairing trouble on wires and poles, in manholes and for trench work, and it may be used for high-tension transmission lines and towers and for temporary construction and maintenance of outdoor substations.

For work where it is only necessary to light up the immediate foreground the searchlight can be furnished with a wide-angle reflector which throws a very white diffused light instead of a beam.

Dual Purpose Farm Lighting Equipment

Belt power for overhead shafting and direct-connected machinery is supplied, as well as energy for charging batteries and delivering electrical energy, by the farm lighting outfit that is being manufactured by the Marron Manufacturing Company, Rock Island, Ill. The engine, generator and switchboard are all built in the Marron factory and are equipped with Edison batteries. The unit is driven by a single-cylinder vertical engine that is simple in construction and has a housing containing all movable parts. These parts are very easily accessible and may be reached by sim-

FLYWHEEL MAY BE USED FOR PULLEY FOR POWER PURPOSES

ply removing covering plates. The speed of the engine is controlled by means of a governor entirely inclosed which runs in oil. The board carries a field rheostat, a single-pole, double-throw switch on the ignition circuit, a high-grade voltmeter, an ammeter, a time switch and an automatic cut-out. The feature of the set is the automatic time switch. The batteries are charged for the time set, and the plant automatically cuts off its work. The 1.75-kw. generator is directly connected to the engine shaft by means of a flexible coupling. The over-all dimensions of this plant are 37 in. (94 cm.) long, 27 in. (69 cm.) wide and 44 in. (113 cm.) high, and the shipping weight is approximately 650 lb. (285 kg.).

Magnetic Thermo Flashers for Electric Signs

High efficiency is claimed to be the feature of a flasher operating on a thermal and magnetic principle which is marketed by the M. C. Ryan Company, Phoenix, N. Y. The thermo circuit of

this flasher is independent of the sign load and does not have springs or other moving parts to get out of order. Contacts are made of a special composition of metal and carbon, ⅝ in. and ½ in. (1.58 cm. and 1.27 cm.) in diameter,

TWO-CIRCUIT FLASHER MOUNTED IN WEATHERPROOF CABINET

respectively giving a non-welding and minimum arcing break. The thermo element has two parallel bars from the same die and stock, in order that they may expand and contract together under any climatic changes. This makes the length of the flash and its duration always uniform in times per minute regardless of the sign load. The accompanying illustration shows a two-circuit, 660-watts-per-circuit flasher mounted in steel weatherproof cabinets. The company also manufactures a four-switch flasher, but this is not mounted in a cabinet.

Rectifier for Charging Storage Batteries

Both the positive and the negative halves of the alternating-current wave are rectified into a steady unidirectional charging current by means of a full-wave magnetic rectifier that is being manufactured by the France Manufacturing Company of Cleveland, Ohio. This device consists of a vibrating rectifier mounted with a variable carbon

FULL-WAVE MAGNETIC RECTIFIER

resistance unit. The device is especially adapted for charging automobile batteries and may be fitted into an ordinary lamp socket. An ammeter is supplied with the device to indicate the rate of charging.

Inclosed Rheostat for Garages

An interlocking overload and underload release circuit breaker is the feature of a "Universal" rheostat that has been placed upon the market by the Ward Leonard Electric Company of Mount Vernon, N. Y. The overload circuit breaker protects the rheostat, the battery and the entire circuit against excessive current. The underload circuit breaker prevents the battery from

BATTERY CONTROLLED BY OVERLOAD AND UNDERLOAD CIRCUIT BREAKER

discharging back into the lines. The rheostat lever and the circuit breaker are so interlocked that when the circuit breaker is open it is necessary to move the rheostat in a position of minimum charging rate in order to close the circuit. The circuit breaker is entirely inclosed so that it cannot be tampered with by the operator.

Threadless Pipe Fitting

Threading of pipes for use on switch and bus structures is entirely eliminated by means of a rigid and neat-appearing framework fitting that is being marketed by the Railway & Power Engineering Corporation, Ltd., Canadian Pacific Railway Building, Toronto, Canada. A floor flange, shown in the accompanying illustration, consists of a flat casting about 0.375 in. (9.5 mm.) thick, in the center of which is a boss of suitable diameter to fit neatly inside the pipe. A threaded stud is secured in the center of this boss. A triangular wedge with the point toward the flange is attached to this stud. Three small wedges of suitable dimensions and with their outer side curved to the inside diameter of the pipe are placed against

END OF PIPE HELD FIRMLY AGAINST FLOOR FLANGE

the triangular wedge, the group being then inserted inside the pipe.

A slight movement tending to draw the wedges out of the pipe causes the outer wedges to engage the inner wall of the pipe and the central wedge immediately locks. The fitting is then tightened by turning the pipe or the

flange which bears against the end of the pipe, thus allowing the central wedge to be drawn into close and tightly engaging contact with the outer wedges of the flange so as to force them into rigid engagement with the inner wall of the pipe. To remove the fitting from the pipe it is only necessary to give the fitting a few turns back on the pipe and to give the fitting a tap of a hammer toward the pipe. This loosens the wedges and they can then be slipped out of the pipe. This method of fastening the pipe can be applied to any fitting.

Pumps with Interchangeable Cylinders

A line of power-driven pumps that will pump from 200 gal. to 6000 gal. (757 l. to 22,711 l.) of water per hour against pressures varying from 20 lb. to 125 lb. per square inch (1.4 kg. to 8.8 kg. per sq. cm.), lifting the water from 40 ft. to 250 ft. (12.1 m. to 76.2 m.), is being manufactured by the Midvale Machine Works, Railway Exchange Building, St. Louis, Mo. Each cylinder in these pumps, the number of which ranges from two to twelve,

VALVE OPENINGS EQUAL IN SIZE TO PLUNGER AREAS

with its valve and valve chamber, is a separate and distinct interchangeable unit and can be removed in a short time without interfering with the operation of the other cylinders. This, it is claimed, is a special Midvale feature. The valve openings are equal in size to the plunger area. No packing or stuffing boxes are used. Lubrication is secured by compression grease cups on all bearings. The bases of the pumps are made of close-grained cast iron cast in one piece. The manifold is cast in the base with suction and discharge openings on two sides and one end.

Electrically Driven Grinder for Laboratory Use

For grinding samples of cottonseed cake, linseed cake, corn cake and food-stuffs of all kinds, as well as various sorts of material used in laboratories for analysis, the Bauer Brothers Company of Springfield, Ohio, has developed an electrically driven grinder. It consists of a Robbins & Myers motor with one end head replaced by the

grinder mechanism which is directly connected to the motor shaft. The grinder case opens on a hinge, and all interior parts are readily accessible and easily cleaned. This allows a variety of materials to be ground in the machine without any one sample being contaminated by the others. The outfit is also used where small amounts of materials are ground continuously, and for this service it is provided with a special base which permits a constant flow of material to pass through the mill. The device over all is 24 in. (61 cm.) in height, 16 in. (41 cm.) in width and 25 in. (63 cm.) in length. The hopper is 10 in. (25 cm.) in diameter, and the plates are 8 in. (20 cm.) in diameter. The speed of the motor is 1800 r.p.m., and the total weight is 300 lb. (136 kg.). The outfits are regularly stocked with a 3-hp., 220-volt, three-phase, 60-cycle motor, but can be furnished with the two-phase or three-phase, 110, 440 or 550-volt motors if desired.

Electric-Gas Brazing Torch for Use in Shops

Sometimes it is desired to have an electric torch for annealing and hardening of small tools, brazing, heating soldering irons, heating melting pots, soldering, etc., when there is no compressed air available. To eliminate the necessity of installing an air compressor, the Tyler Manufacturing Company, 64 Pearl Street, Boston, has placed upon the market the "Bantam" electric-gas brazing torch. This device consists simply of a turbine fan driven by a motor connected to the torch, which is supplied with illuminating gas by means of a hose. All that is needed to operate this torch is a source of electric energy and a supply of gas. The torch will develop on illuminating gas a temperature of about 2300 deg. Fahr. The motor will supply a quantity of air sufficient to operate four burners like the one regularly furnished with the torch, and if the torch is equipped with

ELECTRIC MOTOR SUPPLIES ENOUGH AIR FOR FOUR BURNERS

four burners, the manufacturers claim that it will make a very complete small furnace. The device is especially adaptable for use on ships that are not equipped with compressed air. This avoids the inconvenience and delay consequent upon the use of the ordinary gasoline torch.

Trade Notes

THE BODINER ELECTRIC COMPANY of Chicago is represented in the New York territory by John H. Barker, 95 Liberty Street, New York City.

THE WAR TRADE BOARD of Washington, D. C., announces that, effective June 1, telegraph apparatus has been added to the export conservation list.

THE S. W. ELECTRIC COMPANY of New York City has been appointed sole distributor of the products of the William F. Wolff Company, manufacturer of lamp brackets.

THE BLAW-KNOX COMPANY of Pittsburgh, Pa., has removed its San Francisco office from the Rialto Building to the new office and warehouse at 528-530 Second Street. O. B. Pulis is in charge.

DUNCAN BOND of Denver, Col., has joined the sales force of the Packard Electric Company, Warren, Ohio. He will look after the business of the company in his section, with headquarters at Denver.

THE WAR TRADE BOARD of Washington, D. C., in supplement No. 3, publishes a "Cumulative Supplement to Enemy Trading List," revised, containing additions, removals and corrections from March 15 to May 17, 1918.

THE ELECTRICAL MACHINERY SALES COMPANY of Howell, Mich., has recently opened an office in the First National Bank Building of Milwaukee, Wis., to represent the Howell Electric Motors Company in Wisconsin.

CARL GOLIN has resigned as manager and treasurer of the Northwestern Storage Battery Company of Chicago and is now with the sales department of the United States Rubber Company, mechanical division, at Milwaukee, Wis.

JOHN H. BARKER of New York City, handling electrical equipment for factories, has the sole agency in the metropolitan district for the Reliance motor-driven swing saw, manufactured by the Reno-Karthor Electric Company of Cincinnati, Ohio.

THE WESTINGHOUSE LAMP COMPANY of New York City held its annual meeting of the district managers and heads of departments at the Gedney Farm Hotel, White Plains, N. Y., all last week. The sessions were of an executive nature.

THE WADSWORTH ELECTRIC MANUFACTURING COMPANY, INC., of Covington, Ky., is now incorporated under the laws of the State of Kentucky, with a capital stock of \$100,000, for the purpose of manufacturing electrical appliances.

THE GEORGE T. RENKE CORPORATION of New York City has issued a booklet entitled "A Few Facts in Latin-American Export Trade," by B. Joachim. It deals specifically and informally with trade possibilities in that part of the world.

J. P. NICKONOW, formerly with the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., and lately with the Russian Artillery Commission, has established himself at 52 Vanderbilt Avenue, New York City, as a designing and consulting engineer.

O. S. LAIR, department manager for the Western Electric Company in various cities of the United States for the last seventeen years, and for the last four years manager of the Los Angeles (Cal.) office of the company, has resigned. Mr. Lair will become associated with the W. Ross Campbell Company of Los Angeles.

THE JEFFERY-DEWITT INSULATOR COMPANY, Huntington, W. Va., which has opened its new plant at Kenova, W. Va., as announced in the ELECTRICAL WORLD for June 8, will continue the present factory at Detroit and enlarge it to meet the demands for manufacturing spark-plug porcelains and other porcelain material of that nature.

A. HUETTER, for a number of years superintendent of the Boonton (N. J.) Rubber Manufacturing Company, is now vice-president and general manager of the Premier Rubber & Insulation Company of Dayton, Ohio. The new plant of the company, completed April 1 and in operation since May 1, is a one-story brick building, 68 ft. by 100 ft., with a separate power house of its own.

THE EMIL GROSSMAN MANUFACTURING CORPORATION of Brooklyn has opened a showroom in the Buick Building, 1733 Broadway, New York City, for the transaction of export business primarily. It will have on display all of the products which the concern manufactures. The

office is under the management of Sidney S. Frank. The executive offices will be continued in the Bush Terminal Building, No. 20, Brooklyn.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY of East Pittsburgh, Pa., has purchased the property, business and good will of the Krantz Manufacturing Company, Inc., of Brooklyn, N. Y., manufacturer of safety and semi-safety electrical and other devices, such as auto-lock switches, distribution panels, switchboards, floor boxes, bushings, etc. The supply department of the Westinghouse Company will act as exclusive sales agent of the products of the Krantz Manufacturing Company, whose business will be continued under its present name. H. C. Hoke of the Westinghouse company, will represent the supply department at the Krantz factory.

Trade Publications

SOCKETS, RECEPTACLES, ETC.—Pass & Seymour, Inc., Solvay, N. Y., is distributing form 1244, discount sheet effective May 18, 1918, of sockets and receptacles, etc.

SWITCHES.—The Ceco switch is described in a circular being distributed by the California Electrical Construction Company, 641 Mission Street, San Francisco, Cal.

FARM LIGHTING SYSTEMS.—The Gray Electric Company of Springfield, Ohio, is distributing bulletin D, describing and illustrating the "Ruralite" farm lighting system.

PORTABLE INSTRUMENTS.—Bulletin 46,018A, issued by the General Electric Company, Schenectady, N. Y., describes construction and specification of its portable instrument type P-8.

FUSES.—The Bussmann Manufacturing Company, St. Louis, Mo., has issued a bulletin describing and illustrating its fuses for all types of electric circuits. This includes plug fuses, cartridge fuses and auto fuses.

ELECTRICAL SUPPLIES.—Catalog 6311 of Hibbard, Spencer, Bartlett & Company, State Street Bridge, Chicago, lists a complete line of electrical specialties. Price lists of these devices are included in the catalog.

RECTIFIERS.—Bulletin 22, issued by the France Manufacturing Company of Cleveland, Ohio, illustrates and describes the use and application of its alternating-current and direct-current battery boosters and rectifiers.

PORTABLE SEARCHLIGHT.—The portable Electric Searchlight Company of 87 Haverhill Street, Boston, Mass., has issued a circular describing, illustrating and showing the use of its Bay State portable electric searchlight.

ELECTRIC COOKING.—The Edison Electric Appliance Company of Chicago has issued a bulletin giving an address by George A. Hughes on "Electricity the Nation's Conservator," which was presented before the Minnesota Electrical Association at Minneapolis on March 12.

PORCELAIN.—The Illinois Electric Porcelain Company, Macomb, Ill., has issued a catalog on electrical porcelain installations in which it features knobs, clevis, switch bases, tubes, strain insulators and telephone and electric light and power insulators for distribution voltage. The catalog contains twenty-four pages and is illustrated.

COOLING TOWERS.—The Wheeler Condenser & Engineering Company of Carteret, N. J., has issued a bulletin showing the Wheeler-Balke cooling tower in numerous designs and capacities varying from a few thousand gallons per hour to nearly a million gallons per hour. Several pages are also devoted to Wheeler-Barnard forced-draft cooling tower. The booklet is well illustrated with actual installations.

CONDUIT FITTINGS.—The Appleton Electric Company, 218 North Jefferson Street, Chicago, is ready to distribute its new 160-page catalog covering its complete line of "unilets" and other conduit fittings. This catalog is furnished in two sizes—that is, standard electrical manufacturers' size and a convenient pocket size. This catalog contains the numbers of new fittings recently placed upon the market by this company. A feature of the catalog is the pictorial index, which facilitates the selection of fittings required for any installation. A catalog in either size will be sent upon request.

New Incorporations

THE ELECTRICAL SUPPLY & REPAIR COMPANY of Hazard, Ky., has been incorporated with a capital stock of \$25,000 by C. E. Carlin, J. B. Hoe and R. L. Cornell.

THE DALLAS (TEX.) PRESTO BATTERY & SERVICE COMPANY has been incorporated with a capital stock of \$5,000 by J. V. Crannell, H. J. Crannell and P. C. Vines.

THE FARMERS' ELECTRO LIGHTING CORPORATION of Aberdeen, S. D., has been incorporated with a capital stock of \$25,000 by Fred P. Tosch, R. H. Garhne and Paul G. Tosch.

THE LALLEY ELECTRIC SHIFTER COMPANY of Detroit, Mich., has been incorporated with a capital stock of \$25,000 by William H. Lallely, Arthur M. Botsner and Henry Kennedy.

THE WADSWORTH ELECTRIC MANUFACTURING COMPANY of Covington, Ky., has been incorporated by George Wadsworth, Harry W. Percival and Alfred Allen. The company is capitalized at \$100,000.

THE TASSIN BATTERY CORPORATION of Norfolk, Va., has been incorporated with a capital stock of \$45,000 to manufacture and deal in electric batteries. The officers are: C. H. Hix, president, and R. H. Baker, secretary.

THE BROOKLYN (N. Y.) ELECTRIC WELDING CORPORATION has been chartered with a capital stock of \$50,000 to do a general contracting and electric welding business. The incorporators are: J. Kjerstad, H. B. Payne and J. B. Morris, 764 Court Street, Brooklyn.

THE SPRINGWATER (N. Y.) ELECTRIC LIGHT COMPANY has been incorporated by Albert W. Howe, Louis J. Hyde and Ebenezer Robinson of Springwater, N. Y. The company is capitalized at \$7,500 and proposes to generate electricity for lamps, heaters and motors.

THE NEW YORK ELECTRIC WELDING CORPORATION of Brooklyn, N. Y., has been incorporated by J. Kjerstad, H. B. Payne and J. B. Morris, 764 Court Street, Brooklyn. The company is capitalized at \$25,000 and proposes to a general contracting electrical welding business.

THE PRINCETON (IND.) UTILITIES COMPANY has been chartered by James C. Johnston, Samuel T. Heston, Jacob L. Knauss and Sampel L. May. The company is capitalized at \$40,000 and proposes to supply light, heat and power and water in Princeton and surrounding country.

THE HANA (HAWAII) ICE & ELECTRIC COMPANY has been incorporated with a capital stock of \$20,000 to generate electricity and to manufacture ice. The ice plant of the Hana Ice Works will be acquired. John Chalmers is president and G. Errett secretary and treasurer.

THE ELECTRIC EQUIPMENT COMPANY of Davenport, Iowa, has been chartered with a capital stock of \$50,000 to sell and deal in electrical fixtures, etc. The officers are: J. S. Kimmel, president and treasurer; F. E. Downing, vice-president, and A. Butler, secretary and assistant treasurer.

THE MONTCLAIR (N. J.) STORAGE BATTERY COMPANY has been chartered with a capital stock of \$25,000 to deal in electrical equipment and to carry on an automobile business. The incorporators are: Helen V. Chambers, Edith L. Woodhead and William J. Woodhead, all of Montclair.

THE WYOMING WATER & LIGHT COMPANY of Mullens, W. Va., has been incorporated with a capital stock of \$50,000 to operate light, heat and water plants. The incorporators are: D. D. Maron, A. W. Daubensneek, D. M. Klein, N. C. Bunch, J. A. Radwan and L. R. Taylor, all of Mullens.

THE BRODY ELECTRICAL COMPANY, 586 Spring Street, West Hoboken, N. J., has been chartered with a capital stock of \$10,000 to deal in electrical fixtures. The incorporators are: Abraham P. Terk of New York, N. Y.; Max Cohen, 78 New York Avenue, Union Hill, and Samuel Brody, Spring Street, Hoboken.

THE CHADBURN (SHIP) TELEGRAPH COMPANY OF AMERICA, of New York, N. Y., has been incorporated by W. P. Allen, 214 St. James Place, Brooklyn; F. A. Whitney, 50 West 121st Street, and J. L. Galey, 39 West Twenty-seventh Street, New York City. The company is capitalized at \$50,000 and proposes to manufacture electrical appliances and to do a general electrical and engineering business.

New England States

EASTPORT, ME.—In the issue of May 11 an item was published stating the Eastport Electric Company, recently organized, is installing a new plant in Eastport. We are informed that this information is incorrect. The town is now served by hydro-electric power.

LOWELL, MASS.—Plans are being prepared by the Lowell Electric Light Corporation for extensions to its power plant to provide space for the installation of new boilers. The cost of the proposed improvements is estimated at \$10,000.

PROVIDENCE, R. I.—The stockholders of the Narragansett Electric Lighting Company have voted to authorize \$1,700,000 in securities, subject to the approval of the Federal Reserve Board. It granted the proceeds will be used to pay for improvements, already made, amounting to \$600,000, and to include the new boiler house, 60,000-hp. turbine, the transmission lines to Westerly and cables to the North End and East Providence; also for additional improvements, which will include four new boilers of 600 hp. each, a 66,000-volt transmission line over the river on towers 150 ft. high, north of Fox Point and East Providence, and a transmission line from Swansea to Warren for increasing the power loads in that section.

Middle Atlantic States

BROOKLYN, N. Y.—Plans have been filed by the Kings County Lighting Company for the construction of an addition to its plant at Fifty-fifth Street and First Avenue. Contract has been awarded to P. S. Lane, 110 West Fortieth Street, New York City. The cost is estimated at about \$10,000.

BUFFALO, N. Y.—Plans are under consideration by the City Council for the installation of a new electric-lighting system in Oak, Vine and Elm Streets. Arc lamps will be used.

COBLESKILL, N. Y.—Bids will be received by D. D. Frisbie, president of board of trustees, Schoharie State School of Agriculture, Agricultural Hall, State and Lodge Streets, Albany, until June 28 for construction, including heating, sanitary and electric work of home economics building at the Schoharie State School of Agriculture. Drawings and specifications, etc., may be obtained at the Department of Architecture, Capitol, Albany. Drawings and specifications may be consulted at the school at Cobleskill and at the New York office of the Department of Architecture, Room 1224, Woolworth Building, New York.

GOUVERNEUR, N. Y.—The Village Board has renewed a contract with the Oswegatchie Light & Power Company for a period of five years for pumping the village water supply for \$6,000 per year. Under the previous contract the service was furnished at \$3,700 per annum.

NEW YORK, N. Y.—Arrangements are being made by the Interborough Rapid Transit Company, 165 Broadway, for a bond issue of \$37,700,000 for improvements and equipment, including extensions to power plants, etc., involving an expenditure of about \$2,391,000.

NEW YORK, N. Y.—The New York Edison Company, it is reported, is contemplating the construction of a large electric generating station for the Harlem River, Port Morris section, to cost about \$5,000,000. The company has recently acquired a site bounded by 133rd and 134th Streets, Walnut Avenue and the East River.

OXFORD, N. Y.—Bids will be received by Mrs. Georgiana Griffith, president of the board of managers of the New York State Women's Relief Corps, Oxford, until July 3 for refrigeration plant at the New York State Women's Relief Corps Home. Drawings and specifications may be consulted at the home, Oxford, at the New York office of the Department of Architecture, Room 1224, Woolworth Building, and at the Department of Architecture, Capitol, Albany. Lewis F. Pilcher is state architect.

ROCHESTER, N. Y.—Bids, it is reported, are being received by the Bridgeport Tool & Machine Company for the construction of a machine shop, three stories, 60 ft. by 200 ft., on Winston Road, to cost about \$50,000. R. S. Byers, Chamber of Commerce Building, is architect.

FREEHOLD, N. J.—Bids will be received by the County Board of Freeholders until July 3 for power equipment, installation of electric wiring, etc., and new heating system in connection with the erection of the proposed new tuberculosis hospital for the county. A new power house will also be built at the institution. Charles H. Wyckoff is director.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

JERSEY CITY, N. J.—The Jersey City Harbor Service Corporation has applied to the City Commission for permission to build a new marine terminal and industrial plant on a tract consisting of 160 acres in the Greenville section, near the Pennsylvania Railroad terminal, to cost approximately \$7,500,000. Considerable machinery and equipment will be required for the proposed plant. Walter H. Condict, 15 Exchange Place, is representative of the company.

MAY'S LANDING, N. J.—The Bethlehem Loading Company has begun work on the construction of 12 units at its new ammunition works at May's Landing, which will include a new power plant. A new village will be established at the works to be known as Belcoville. The company is affiliated with the Bethlehem Steel Company of South Bethlehem, Pa.

NEWARK, N. J.—Contract has been awarded by the Heller & Merz Company, Hamburg Place, Newark, for the construction of a new power plant, 37 ft. by 70 ft., to E. M. Waldron, Inc., 665 Broad Street, Newark.

NEWARK, N. J.—Bids are being asked by the Day Elder Motors Corporation, 161 Ogden Street, Newark, for the construction of a truck manufacturing plant, 125 ft. by 450 ft., at Colt Street and Clinton Avenue, Irvington. The company manufactures automobile trucks.

DOWNINGTOWN, PA.—Application has been made to the Public Service Commission by the Downingtown Light & Power Company for a charter to install and operate an electric plant to supply electricity for domestic and industrial use in Downingtown.

PHILADELPHIA, PA.—The Coatesville Boiler Works, Morris Building, has the contract for improvements and alterations in the boiler plant of Adolph Weicht & Sons, 730 Rising Sun Lane.

PHILADELPHIA, PA.—The committee on street railways of the City Council has reported favorably on an ordinance authorizing the Philadelphia Railway Company to build an extension from its southwestern electric railway to the Hog Island ship-building plant.

PHILADELPHIA, PA.—Plans have been filed and contract awarded by the St. Joseph's Academy, Chestnut Hill, near Philadelphia, for the construction of a new boiler plant at the institution at the city line and Germantown Avenue. John McShain, 1610 North Street, has the contract.

PHILADELPHIA, PA.—Bids will be received by the United States Marine Corps, Quartermaster's Department, Washington, D. C., until June 25, to be opened by the depot quartermaster, Marine Corps, 1100 South Broad Street, Philadelphia, Pa., for furnishing 50,000 ft. cotton-covered lamp cord and 2000 lb. insulated tape. Proposal blanks and other information may be obtained upon application to the above office or to depot quartermaster, Marine Corps, 1100 South Broad Street, Philadelphia, Pa.

WILMINGTON, DEL.—The Wilmington & Philadelphia Traction Company, it is reported, will petition the War Finance Corporation for a loan to enable it to make improvements to its plans as recommended by the Public Utilities Commission, to include the installation of two new boilers and a rotary converter.

BALTIMORE, MD.—Contract has been awarded by the Bartlett-Hayward Company, Scott and McHenry Streets, to Morrow Brothers for the erection of a one-story addition, 130 ft. by 450 ft., to cost about \$300,000, and a one-story building, 130 ft. by 378 ft., to cost about \$100,000.

BRADSHAW, W. VA.—The Bradshaw Coal Company of Bluefield, recently organized, has taken over the holdings of the Bradshaw Pocohontas Coal Company of McDowell County. New equipment, to cost about \$75,000, will be purchased. Electricity will be secured from the Appalachian Power Company of Bluefield. C. L. Biddison of War Eagle is engineer.

MORGANTOWN, W. VA.—The West Virginia Traction & Electric Company has begun work on the erection of a new transmission system from Morgantown to Masontown to supply energy to the plant of the Elkins Coal & Coke Company.

MULLENS, W. VA.—The Wyoming Water & Light Company, recently incorporated with a capital stock of \$50,000, pro-

poses to operate an electric light, heating and water plant. Among the incorporators are D. D. Maron, D. M. Klein and L. R. Taylor, all of Mullens.

ALEXANDRIA, VA.—The War Department will erect a laundry building, equipped with machinery, at Camp Humphreys, to be located near the base hospital. It is proposed to enlarge the power house at the hospital to enable it to supply steam and power to the laundry.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 24, under specification 3077, for an electric freight elevator at the Navy Yard, Washington, D. C.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 24, under specification 2967, for improvements to power plant at the Washington Navy Yard, to cost about \$36,000.

WASHINGTON, D. C.—Contracts have been awarded by the War Department to the Air Nitrates Corporation for the construction and operation of nitrate plant No. 3. The two half units of this plant will be located, one at Elizabethtown, near Cincinnati, and the other near Toledo, Ohio. Work on construction will begin at once.

WASHINGTON, D. C.—Bids will be received at the Bureau of Standards, Department of Commerce, Washington, D. C., until June 30 for performing miscellaneous electrical work during the fiscal year ending June 30, 1919. Specifications and proposal blanks may be obtained upon application to the superintendent of the mechanical plant, Bureau of Standards, Washington, D. C.

WASHINGTON, D. C.—To make extensions and improvements necessary that electric power plants may meet the demands made upon them by the war program an appropriation of \$200,000,000 is to be asked of Congress. This step has been decided on by the War Industries Board in answer to the complaints of power companies in the eastern territory that finances are needed with which to expand their plants to meet the increased demand for electricity in the production of war materials. The electric power plants in the following districts are to be proposed to receive financial aid: Niagara, Pittsburgh, Philadelphia, Pa.; Wilmington, Del.; Baltimore, Md.; Newark, Camden and Burlington, N. J.; Alliance, Massillon and Canton, Ohio; Connellsville, Pa., and Claremont, N. H.

North Central States

DETROIT, MICH.—Henry Ford is reported to have acquired mill property in Southfield, together with machinery and water rights, for the purpose of supplying electricity to the foundry being erected in River Forge.

DETROIT, MICH.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until July 10 for the installation of two electric elevators in the United States post office and court house at Detroit. For details see Searchlight Section.

DETROIT, MICH.—Plans are being prepared for the erection of a five-story factory building, 472 ft. by 66 ft., for the Burroughs Adding Machine Company, Second and Burroughs Avenue. The cost of the building is estimated at \$750,000. A. Kahn and E. Wilby, Marquette Building, Detroit, are architects.

SAGINAW, MICH.—The Wolverine Tractor Company, Ford Building, Detroit, is contemplating the erection of a plant in Saginaw. New factory equipment, including a pneumatic riveting plant, lathes, milling machines, drill presses, etc., will be required.

COLLINWOOD, OHIO.—The New York Central Railroad Company is contemplating the purchase of two 10-ton and one 20-ton electric traveling crane and four locomotive cranes for its Collinwood shops.

SPRINGFIELD, OHIO.—Plans have been prepared by the Ohio Electric Company for the removal of its car barns, repair shops and storage house from Columbus to Springfield. Ground has been purchased for the new addition in West North Street and contract has been awarded for the construction of the storage house. Contracts for other buildings have not yet been awarded.

HAZARD, KY.—The Electrical Supply & Repair Company of Hazard is contemplating the construction of a machine and repair plant, to cost about \$20,000.

LOUISVILLE, KY.—Bids, it is reported, will soon be asked by the Louisville Carriage & Taxicab Company, 421 Third Street, for the construction of a garage at Second

and Walnut Streets, to cost about \$75,000. D. X. Murphy & Brother, Louisville Trust Building, are architects.

ANDERSON, IND.—The Hill Pump Company of Anderson has taken over the factory formerly owned by the Wagner Axle Company, which is being enlarged by a foundry, machine shop and boiler house. The foundry will be equipped with three traveling cranes and six jib cranes. The cost of the work is estimated at \$100,000.

DANVILLE, IND.—The Public Service Commission has authorized the Merchants' Heat & Light Company of Indianapolis to issue \$135,000 in bonds and \$40,000 in capital stock for the purpose of taking over the property of the Danville (Ind.) Light, Heat & Power Company.

PERU, IND.—Additional locomotive shops, to cost about \$1,000,000, will be erected at Peru by the Pennsylvania Railroad Company.

CHICAGO, ILL.—Plans have been filed by the Electric Steel Company, South Wood Street, for the erection of a new foundry at 1801-31 West Thirty-first Street, to cost about \$100,000.

MANITOWOC, WIS.—Preparations are being made by the Board of Public Works for the installation of a 1500-kw. turbo-generator unit, with accessories, for the municipal electric-light plant, for which bids have been received.

MORRISVILLE, WIS.—The Board of Education has engaged Edward Tough, architect, 24 East Millin Street, Madison, to prepare plans for a three-room addition to the high school to be equipped for manual training work.

NEILSVILLE, MINN.—Bids will be received by T. A. Thompson, clerk, Nashville, until June 28 for electric-lighting fixtures and a 3-kw., 160-amp. lighting plant for the Neilsville school. William F. Kurke, 31 Huntington Block, Fargo, N. D., is architect.

ALLENDORF, IOWA.—Application has been made to the Board of Railroad Commissioners of the State of Iowa by the Allendorf (Iowa) Electric Company for a franchise to erect and operate an electric transmission line along certain roads and highways in Osceola County for the transmission of electricity for lamps and motors. Electricity for operating the system will be obtained from the transmission line owned by the Ochevedan (Iowa) Electric Company.

SIOUX CITY, IOWA.—Bids will be received by Gardner & Lindberg, engineers, Chicago, Ill., for the construction of a meat packing house, including power house, for the Midland Packing Company, to cost about \$750,000.

ADRIAN, MO.—At an election held recently the proposal to grant a franchise to Mr. Green to install and operate an electric lighting system in Adrian was carried.

ARCHIE, MO.—Contracts have been awarded by the Green Light & Power Company of Pleasant Hill for the erection of an electric transmission line to connect Archie and Pleasant Hill. The cost is estimated at \$100,000.

KANSAS CITY, MO.—Contract has been awarded by the Kansas City Railways Company for the construction of a new substation, 43 ft. by 82 ft., to L. Breitag & Son Construction Company, at a cost of \$25,000.

KANSAS CITY, MO.—The Jansen Ealsbery Laboratories is contemplating the construction of a factory building, 123 ft. by 60 ft., three stories high, for the manufacture of veterinary supplies, to cost without mechanical equipment about \$60,000. The plans provide for electric-lighting installation and electric elevators. Ernest O. Brostrom, Reliance Building, Kansas City, is architect.

MARSHALL, MO.—Bonds to the amount of \$80,000 have been voted for the construction of a municipal electric-light plant. Henrici & Lowry, Commerce Building, Kansas City, are engineers.

RICH HILL, MO.—Bonds to the amount of \$14,000 have been voted for improvements to the municipal electric-light and power plant.

ST. LOUIS, MO.—The Union Electric Light & Power Company is planning to remodel its boiler house, at a cost of about \$15,000.

BELVIDERE, NEB.—Bids will be received by the town of Belvidere until June 28 for construction of an electric distributing system, including three 10-kw., 13,000/2000-volt, three-phase, 60-cycle, step-down transformers, 80-kw. (total capacity) 2200/110/220-volt, single-phase, 60-cycle, pole-type transformers, all provided with oil hangers and blocks, one 5-kw. series transformer with panel and instruments for 6.6-amp., 110-volt, 60-cycle alternating-current house meters and five 10-amp.

meters. The cost of the work is estimated at about \$5,500. Charles F. Sturtevant, Holdrege, is engineer.

CLAY CENTER, KAN.—The municipal electric-light plant was recently damaged by the explosion of a flywheel, causing a loss of about \$40,000.

JUNCTION CITY, KAN.—Bids are being taken (to close soon) by the Union Pacific Railway Company, Union Pacific Building, Omaha, Neb., for the construction of a 20-stall roundhouse, power house, storehouse, including electric wiring, steam piping, etc., in Junction City. R. L. Huntley, Union Pacific Building, Omaha, Neb., is chief engineer.

MANHATTAN, KAN.—The Manhattan City & Interurban Railway Company is contemplating the purchase of a second-hand 200-kw. rotary converter.

NEWTON, KAN.—Bids will be received by Adella Martin, city clerk, Newton, until July 3 for the construction of a sewage disposal plant, including two 300-gal. per minute motor-driven centrifugal pumps and pumping station. Black & Veatch, Interstate Building, Kansas City, Mo., are engineers.

Southern States

BRUNSWICK, GA.—The Butterworth-Judson Corporation, 61 Broadway, New York, N. Y., will install an electric-light and power plant to furnish electricity for lamps and motors to the proposed industrial city development, to cost \$2,000,000, in connection with the \$5,000,000 picric acid plant, which the company is building for the United States government in Brunswick.

JEFFERSONVILLE, GA.—Bonds recently voted for improvements to the municipal electric-light plant and water-works system have been sold, bringing a total of \$15,000. Work will begin at once on the proposed improvements.

MACON, GA.—The Central of Georgia Railway Company has awarded contract to the General Railway Signal Company of Rochester, N. Y., for installation of an electric interlocking machine to operate electrical signals and switches on all tracks entering the Macon Terminal yards. The cost is estimated at \$125,000.

MEMPHIS, TENN.—The Yazoo & Mississippi Valley Railroad Company is planning to install an automatic block system between Memphis and Coahoma, a distance of 65 miles, of which 20 miles is double track. The cost of the work is estimated at \$135,000. A. H. Egan is general superintendent.

BIRMINGHAM, ALA.—The 90-mile transmission line of the Alabama Power Company from the power plant in Walker County to the government development work at Muscle Shoals has been completed. The company is now building a 30,000-kw. extension to its Warrior reserve steam plant, which is to be completed by Oct. 1.

WYLLAM, ALA.—The sulphuric acid plant of the Steel Cities Chemical Company, it is reported, will be rebuilt by the construction department of the Virginia-Carolina Chemical Company of Richmond, Va. The plant, it is understood, will be enlarged and will cost from \$150,000 to \$200,000.

DREW, MISS.—Bonds to the amount of \$15,000 have been issued for the installation of an electric-light plant.

GREGORY, ARK.—The Gregory Gin Company, recently organized, is reported to be in the market for power plant and cotton ginning machinery, to cost about \$8,000.

GARBER, OKLA.—The installation of new equipment, to cost about \$20,000, is reported to be under consideration by the Garber Light & Ice Company. William Musser is interested.

OKTAHA, OKLA.—The Oktaha Mill & Elevator Company is planning to install a new plant and equipment, to cost about \$6,000.

WAURIKA, OKLA.—Arrangements are being made by the Consumers' Light & Power Company for the installation of new electrical machinery at its local plant. The proposed improvements will double the output of the power house.

GALVESTON, TEX.—The plant of the Brush Electric Company at Twenty-sixth and Post Office Streets was recently damaged by fire, causing a loss of about \$75,000.

Pacific and Mountain States

AUBURN, WASH.—The City Council has granted the Valley Gas Company a franchise to install a distribution system

and furnish electricity in Auburn. The franchise provides that the work must start before Jan. 1, 1919.

BELLINGHAM, WASH.—The Southwestern Engineering Corporation of Bellingham is contemplating the construction of a power plant in the Mount Baker district. The proposed plant will replace the present plant. The first unit will have a capacity of 75 hp.; the second unit of the same horsepower will be built in the fall.

SEATTLE, WASH.—Plans have been prepared for the erection of a three-story school building and garage 120 ft. by 250 ft. on Queen Anne Avenue for the Seattle Engineering School, Inc. Catalogs of steam, gas and electrical engineering equipment are desired. Sherwood D. Ford, Lyon Building, is architect. William T. A. Faulkner is president.

SPOKANE, WASH.—Preliminary plans for the buildings in connection with the proposed plant of the Washington Tire & Rubber Company, to be erected on Sprague Avenue, east of the city, have been completed. It is proposed soon to construct four buildings, including the main factory building, 300 ft. by 100 ft.; a service station, 50 ft. by 50 ft., and office building, 50 ft. by 60 ft. The power house will be attached to the main building.

SPOKANE, WASH.—The contract for complete electrical equipment of the Titan Feature Film Corporation plant and studio, located near Spokane, has been awarded to the Alexander Electric Company. The plans provide for a complete steam power installation, wiring a number of buildings of Titan City and also special lighting for the indoor stage. Exhaust steam from the generating plant will be used for heating the buildings. The plant will be capable of maintaining 6000 25-watt lamps. J. Don Alexander is president of the Alexander Electric Company.

TACOMA, WASH.—The City Council has passed an ordinance authorizing Hamilton F. Gronen, light and water commissioner, to contract for energy-consuming devices, such as electric heaters, ranges, water heaters, etc., amounting to \$20,000.

FRESNO, CAL.—The Board of Trustees has adopted a resolution authorizing the installation of the electrolit lighting system in extension on Van Ness Avenue to the southern entrance of the city.

LOS ANGELES, CAL.—The installation of new ornamental standards on Broadway, between First and Tenth Streets, and California and First Streets, is under consideration by the City Council.

OAKLAND, CAL.—The construction of an electric railway by the Emergency Transportation Company to connect the plant of the Moore & Scott shipbuilding concern with the San Francisco-Oakland Terminals Railway on Eighth Street has been approved by the city of Oakland. The cost is estimated at \$20,000.

SAN FRANCISCO, CAL.—Application has been filed by E. E. Lindsey of San Francisco for 30 cu. ft. per second of the waters of Buck's Creek, tributary to the North Fork of the Feather River in Plumas County. The proposed project will consist of a timber crib dam 20 ft. high, 75 ft. wide on the bottom and 25 ft. wide on the top, and a flume and ditch 4 miles long. The plans provide for a development of 4750 hp. under a 1400-ft. head, at a cost of about \$153,000.

SONORA, CAL.—The Gold Ridge Mining Company is considering plans for equipping its mines for electrical operation.

SHELBY, MONT.—Contract has been awarded to the Two Miracles Concrete Company for lighting the town, to cost about \$6,000.

CRIPPLE CREEK, COL.—Plans are being considered by the Golden Cycle Mining Company for the construction of a new electric power plant at Pikeview, near Colorado Springs, to cost about \$200,000.

STERLING, COL.—The installation of new street lamps in Sterling is under consideration by the City Council. The Colorado Power Company is rebuilding its local lines and will furnish electricity to maintain the new lamps.

GREEN RIVER, WYO.—Bids are being asked by the Union Pacific Railway Company, Union Pacific Building, Omaha, for the construction of a 20-stall roundhouse, one-story machine shop, power house, storehouse, including electric wiring, plumbing, etc., at Green River, Wyo. H. L. Huntley, Union Pacific Building, Omaha, Neb., is chief engineer.

VALMORA, N. M.—Extensions and improvements are being made to the Valmora Sanatorium, involving an expenditure of about \$100,000. The plans provide for the construction of a power plant and a large reservoir.

Canada

WINNIPEG, MAN.—Tenders will be received by the chairman of the Board of Control, Winnipeg, until June 27 for furnishing and erecting a 10,000,000-gal motor-driven pumping unit, complete with switch-board, wiring, pipe connections, etc., for the McPhillips Street pumping station. Plans and forms of specifications, etc., may be obtained at the office of the city engineer 223 James Avenue, Winnipeg.

TRURO, N. S.—Preparations are being made by the Town Council for the installation of an electric plant, to cost about \$40,000.

HAMILTON, ONT.—Plans have been prepared by the Board of Control for the

construction of a market house, including a refrigerating plant, to cost about \$100,000.

OTTAWA, ONT.—Tenders will be received by John A. Pearson, architect, and J. O. Marchand, associate, Centre Block, Parliament Hill, Ottawa, until July 2 for lighting fixtures required in the construction of the Parliament Buildings. Plans and specifications and further information may be obtained at the office of P. Lyall & Sons Construction Company, Ltd., Ottawa, Ont.

REGINA, SASK.—A by-law providing an appropriation of \$175,000 for a new electric generating unit and other improvements to the municipal electric-light plant has been passed. J. Russell Ellis is acting city engineer.

Miscellaneous

MAUI, HAWAII.—W. D. Stone, manager of the Hawaii Telephone Company, who has charge of the reorganization of the Maui Telephone Company, recently taken over by the Mutual Telephone Company, has recommended that in addition to an expenditure of \$50,000 for the wire system, another \$25,000 be expended in new buildings and equipment. A new central is to be established at Makawae, where a new building, to cost \$3,000, will be erected for that purpose. A new exchange will also be erected in Hana, and the Pau and Lanaina centrals will be remodeled and put in a state of satisfactory repair.

Record of Electrical Patents

Notes on Recent United States Patents

App. filed April 16, 1917. Object is to supply regulatable evaporating means suitable for producing a constant supply of vapor to any inclosure.

1,267,613. MEANS FOR HOLDING BATTERY ELEMENTS; Frank E. Whitney and Martin Melia, Philadelphia, Pa. App. filed July 27, 1916. Will automatically close up any spaces which may exist so that the separators, electrodes, etc., shall be maintained in the most intimate contact.

1,267,620. DRY BATTERY; Ferdinand P. Bauman, Kunsnacht, Switzerland. App. filed Feb. 18, 1916. Relates to plate electrodes and carbon electrodes impregnated with impervious substances.

1,267,959—Connector

1,267,641. RESISTANCE BODY; Georg Egly, Berlin-Treptow, Germany. App. filed Feb. 21, 1914. Electrical resistance bodies which are made preferably from a material known under the name of "silic" consisting essentially of silicon and carbon.

1,267,642. REGULATING RESISTANCE; Georg Egly, Berlin-Treptow, Germany. App. filed Dec. 5, 1914. A regulating resistance having the shape of a segmental cogwheel in which the cogs carry the contacts.

1,267,653. ANODE CONNECTOR; Julius H. Gillis, Toronto, Ontario, Canada. App. filed Oct. 15, 1917. Uses aluminum connectors in electrolytes.

1,267,671. TIMER DISTRIBUTOR; George L. Lang, Newark, N. J. App. filed Oct. 28, 1914. A timer for eliminating "back fires" on a reverse motion of the engine.

1,267,700. RADIATOR; Will R. Savage, Omaha, Neb. App. filed Aug. 21, 1913. An electrically heated radiator.

1,267,706. VACUUM REGULATION; Homer C. Snook and Edwin W. Kelly, Oak Park, Ill. App. filed June 11, 1915. Means for regulating the degree of vacuum of an X-ray tube or other vacuum tube.

1,267,726. RHEOSTAT; Henry J. Wiegand, Milwaukee, Wis. App. filed March 8, 1915. Rheostats of the type known as held regulators.

1,267,727. HOISTING AND CONVEYING APPARATUS; Emory J. Wilson, Cleveland, Ohio. Applied to locomotive crane construction.

1,267,801. PROCESS FOR WELDING TUNGSTEN INGOTS; Carl A. Pfanstiehl, Waukegan, Ill. A process wherein fine particles of metallic tungsten are compressed in a suitable die or mold to form an ingot.

1,267,816. INTERRUPTER MECHANISM. John R. Stark, Racine, Wis. App. filed July 16, 1917. Devices for alternately making and breaking an electric circuit.

1,267,827. ELECTRIC DISCHARGE DEVICE; Willis R. Whitney, Niskayuna, N. Y. App. filed Nov. 6, 1914. Devices to suppress local disintegration or erosion of the cathode.

1,267,846. BATTERY GRID; Clarence H. Cable, Topeka, Kan. App. filed June 25, 1917. Provides an adequate support for the active materials.

1,267,858. INCLOSED-ARC DEVICE; Charles V. Ferguson, Schenectady, N. Y. App. filed July 3, 1916. Devices in which an arc is operated between an incandescent cathode and an anode.

1,267,879. RHEOSTAT; Nils D. Levin, Columbus, Ohio. App. filed Aug. 17, 1915. Provides a resistance device which will have all of its parts compactly arranged.

1,267,888. INCANDESCENT CATHODE DEVICE; George S. Meikle, Schenectady, N. Y. App. filed Aug. 15, 1916. A refractory cathode adapted to operate at incandescence in a gaseous medium.

1,267,919. CONTROLLER; Karl A. Simon and Arthur J. Hall, Wilkinsburg, Pa. App. filed April 4, 1914. Controllers for governing the operation of dynamo-electric machines.

1,267,930. ELECTRIC LOCOMOTIVE; Norman W. Storer, Pittsburgh, Pa. App. filed Nov. 5, 1915. Relates to the arrangement of the trucks embodying the running gears of electric locomotives.

1,267,959. CONNECTOR; Robert A. Becker, Poughkeepsie, N. Y. App. filed Nov. 27, 1916. The end of the tap or branch line is securely held in firm, binding relation with the main cable.

1,267,973. ELECTRIC RESISTANCE DEVICE; Lewis W. Chubb, Edgewood Park, Pa. App. filed Jan. 6, 1915. Provides a resistance device with effective and rapidly operating cooling means.

1,267,976. METHOD AND APPARATUS FOR THE ELECTRICAL REDUCTION OF ORES; Bayard G. Cobb, Dawson City, Yukon, Canada. App. filed May 23, 1913. A method of balancing or controlling the arc.

1,267,978. ELECTRICAL RESISTANCE; John Collinson, Manchester, England. App. filed March 4, 1915. The grids are made of sheet metal which may be either punched, "expanded" or otherwise treated to afford a lengthened path for the current.

1,267,984. IGNITER; Frederic H. Davenport and Howard H. Manning, Meadville, Pa. App. filed June 22, 1914. An igniter with an automatic means for advancing the spark, with devices for controlling the maximum of the advance.

1,267,991. IGNITION DEVICE; Arthur Dickerson, Salt Lake City, Utah. App. filed June 28, 1916. Ignition devices for internal and combustion engines.

1,268,018. CARBON BRUSH HOLDER; J. H. Knight, Fort Worth, Tex. App. filed March 6, 1917. A resilient means for automatically adjusting the carbon brushes.

1,268,031. MOLDABLE MATERIAL; James A. McCoy, Wilkinsburg, Pa. App. filed March 30, 1915. Process of making molded articles that comprises mixing an inert filler with a vegetable oil.

1,266,702. SIGNAL APPARATUS FOR AUTOMOBILES; Bert W. Miller, Boise, Idaho. App. filed Aug. 14, 1916. Apparatus to be actuated by the operator for indicating the direction in which the vehicle is traveling.

1,266,711. STRAIN INSULATOR; Bentley A. Plimpton, Victor, N. Y. App. filed Jan. 25, 1917. Affords a cementless connection between a metal cap, stud or connecting member and the insulating portion of the usual type of strain insulating unit.

1,266,714. TELEPHONE METERING SYSTEM; Charles V. Richey, Washington, D. C. App. filed July 11, 1914. Eliminates mechanical complications and substitutes electrical and electromagnetism means.

1,266,777. PHONOGRAPH; Nelson C. Durand, Newark, N. J. App. filed Sept. 25, 1914. A telephone receiver in the telephone circuit is so mounted as to be capable of being positioned in operative relation to an ordinary phonograph recorder.

1,266,779. ELECTRIC SAFETY LANTERN; Thomas A. Edison, Llewellyn Park, West Orange, N. J. App. filed Oct. 16, 1914. Construction to insure against the ignition of gases or other combustible materials.

1,266,780. STORAGE BATTERY; Thomas A. Edison, Llewellyn Park, West Orange, N. J. App. filed Jan. 20, 1917. Prevents batteries from becoming sluggish in action under certain conditions.

1,266,798. COMMUTATOR; William I. Hallock, Los Angeles, Cal. App. filed April 3, 1917. A timing apparatus for controlling the ignition spark of an internal-combustion engine.

1,266,801. SWITCH-CONTAINING PLUG CONNECTOR; George H. Hart, West Hartford, Conn. App. filed June 20, 1916. Connectors for connecting electric flatirons and other heating appliances in circuit.

1,266,811. BREAKER ARM FOR IGNITERS; Joseph E. Johnson, Meriden, Conn. App. filed Jan. 20, 1917. Relates to igniters for internal-combustion engines.

1,266,814. CURRENT-SUPPLY APPARATUS; Heinrich H. M. Kammerhoff, Orange, N. J. App. filed Dec. 13, 1912. A portable lighting apparatus for use in mines.

1,267,210. ELECTRIC MOTOR CONSTRUCTION; George Gillaspay, Joplin, Mo. App. filed March 17, 1915. Embodies a hollow casing constituting a handle and an electrically operated motor of improved construction snugly fitted within the handle.

1,267,400. METHOD OF TREATING ELECTRODES FOR ELECTRIC WELDING; James H. Gravell, Brooklyn, N. Y. App. filed Oct. 20, 1917. Consists in applying a thin coating of a metal with a low melting point to the bearing surface of the electrode.

1,267,436. SIGNALING DEVICE; Louis W. Martin, New York, N. Y. App. filed March 14, 1917. Provides a simple, compact device which may be worn on the hand, arm or other portion of the body of the user, and through which ocular signals may be given by flashing lights.

1,267,463. ELECTRODE FOR ELECTRIC WELDING MACHINES; Gustave H. Schlommo-dau, Cincinnati, Ohio. App. filed Oct. 8, 1917. Consists of a compound electrode comprising essentially a steel center or core and a copper shell of good conducting material.

1,267,480. ELECTRIC WELDING APPARATUS; Edmund J. von Henke, Lynn, Mass. App. filed Oct. 8, 1917. An electric welding or riveting apparatus adapted for use upon plates.

1,267,481. AUTOMATIC SWITCHING OR CIRCUIT-BREAKING DEVICE FOR ELECTRIC WELDING OR OTHER METAL-WORKING APPARATUS; Edmund J. von Henke, Lynn, Mass. App. filed Oct. 8, 1917. Avoids the use of connecting wires between the welding or metal-working portion of the apparatus and the transformer itself.

1,267,491. HUMIDIFIER; Daniel H. Young and Charles H. Porter, Manchester, Iowa.

New York, Saturday, June 29, 1918

Number 26

Financing Problems Will Be Solved

JUST how and when electric utilities will get the definite government aid in financing which they expected is not plain at the moment. The prospect is not discouraging, because the matter is too vital to the integrity of the national position to be long neglected. We have every faith that in some way the problem will be solved. The first shock resulting from the interpretation of the act creating the War Finance Corporation by the directors of that emergency body served the good purpose of focusing the attention of bankers on the crisis. Now we are at a point where it is seen by Washington and by Wall Street, as well as by the public utility operators themselves, that concerted action must be taken to prevent dangerous potentialities from running too far.

The practical question of financing covers broadly two classes of necessities. One is that of the maturity of outstanding securities or the funding of short-time bank loans; the other is that of providing for construction cost on plant or line extensions required for war or community uses. In many cases these will have to be cared for separately or by different government or private agencies. The two classes, however, are somewhat intermingled. Neither one can be disregarded safely. And all acute financing necessities under war conditions lead inevitably to the rates.

The directors of the War Finance Corporation are not culpable for desiring that utilities which go to them shall be able to stand up financially. As bankers, as good business men, as lenders of government funds, they naturally want to take a minimum of risk, to get a maximum of protection. What we think they have failed to appreciate is the purely emergent character of the situation they deal with. When the government is at war and ordinary business and commercial practices are suspended it is not the time to be a stickler for the normal rule. You simply can't keep things normal. But the fact that the War Finance Corporation directors want to be assured of sound earning capacity in utilities may after all be effective in strengthening the will of state commissions to grant speedy relief in rates.

In measuring dollars we should keep foremost in mind the strident fact that purchasing power has changed. The return on the new investment to-day is much less than fair when that investment has to depend on a rate which has not been increased to square with present costs. The dollar invested does not buy so much equipment or apparatus as it did. The output of the equipment or apparatus is measured in the kilo-

watt-hours, but the revenue from the kilowatt-hours is inadequate unless it is as much greater in proportion than the old rates yielded as the investment and operating cost is greater than the old cost would have been. In brief, if a given new investment in line or apparatus yielded 8 per cent under the old conditions, it would yield say 2 or 3 per cent with present costs, assuming no advance in rates.

These figures are of course subject to variation for individual properties. They are qualified by the consideration that they apply to the new-investment proportion of a company; and that equity of return may be secured either by a large advance in rate for those served by the new property or by a smaller average increase for all customers, whether served by old or new property. But the main argument holds, that rate of return on the investment is a diminishing quantity unless consumers' rates are figured with fair allowance for the costs of operation and extensions under war conditions.

Development of Aerial Power Cables

PRESENT conditions have demanded very rapid increase of power distribution on a large scale. The conditions are commonly enough met by ordinary high-tension construction, but many cases, particularly in thickly settled parts of the country, arise in which this ordinary construction cannot be conveniently used. For some years past the need has been met in such instances by the use of leaded and armored aerial cables such as have already been described in these columns. The paper presented by E. B. Meyer before the A. I. E. E. convention gives an admirable summary of current practice in this highly specialized line. Experience has proved that ordinary leaded cable is too heavy for convenient use, and as a result of much study a special type of cable (armor over reinforced rubber insulation) has been developed which is some 50 per cent lighter than the equivalent leaded cable and seems to meet admirably the somewhat difficult requirements.

The cables are carried on messenger wires, following the usual practice of the earlier telephone cable, and by thorough grounding of this and connecting it also with the armor of the cable proper it is found that the protection from lightning is excellent, in all probability considerably better than would be obtained by the usual forms of line construction. Most of the existing circuits are of 15,000 volts and less, but the same methods have been successfully applied up to 26,000 volts, and there seems to be no reason why still higher powers could not be employed. The Public Service Electric Company

of New Jersey, which has developed this method of line construction, has now in service nearly 25 miles (40.2 km.) of high-tension cable, some of which has been in use for the past seven years with a very striking degree of success. The results, in fact, have been so gratifying as to lead to considerable recent extension of this cable construction, which, without superseding the simpler and more general methods, has certainly a considerable field of usefulness.

America's Electrical Energy Supply

A GAIN the profession is indebted to Dr. C. P. Steinmetz for a most suggestive and striking discussion of the sources of energy available for industrial use. He views the subject in the large, considering the national resources of coal and water power as a potential whole. We have vast stores in this country of undeveloped coal fields and undeveloped water powers, but the total of the latter is, according to Dr. Steinmetz's figures, unmistakably less relatively to the utilization of fuel than one would at first thought suppose. Computing the total water power of the country through mechanical integration, so to speak, of the rainfall and heights above sea level, with due allowance for wastage of every kind in water rendered unavailable, it turns out that twenty-four-hour power of 230,000,000 kw. is approximately the final limit of utilizable energy which can be derived from water power between 30 deg. and 50 deg. north latitude on this continent. The startling bearing of this figure is that it is only about equal to the present total energy consumption of the country and but little more than the total allowance of annual energy produced from coal. In other words, great as is this potential power, it is not enough, even if all utilized, to supply materially more than the present needs of the country were the coal supply to fail, let alone the requirements at some point in the future when there will actually be a serious fuel shortage due to exhaustion of our resources.

A large part of the available hydraulic energy is in comparatively small units, and as Dr. Steinmetz points out, it needs a radical, although perfectly feasible, simplification of methods in order with reasonable economy to collect this scattered energy into a general source of distribution. Of the total potential hydraulic supply by far the larger part is, temporarily at least, economically unavailable. As fuel costs rise, either from actual exhaustion of the supply or by the stern compulsion of deep and difficult mining, more and more of the smaller and less promising water powers will become practically useful; but when that evil time approaches it is safe to say that the energy requirements of the country will have increased at so rapid a rate that even complete utilization of the water powers will afford small measure of relief. It is instructive thus to cast forward and endeavor to see to what ends the failing fuel supply may lead us.

At the present time all the great civilizations of the world lie in climates where mankind stands in sore need of fuel merely for necessary heating. A serious fuel shortage would render a large part of the now civilized world practically untenable by humankind through a large part of the year. As such a period arrives civil-

ization must adjust itself to the new conditions, either by drifting permanently southward to more genial climates or by trying grimly to hold its own by the utilization of every available form of energy.

Dr. Steinmetz very properly called attention to the enormous unutilized solar energy, many times in amount all other sources combined. Numerous attempts have already been made to utilize solar energy, with a fair degree of success. The practical limitation is not in the present somewhat crude apparatus, which is susceptible of great improvement, but in the average cloudiness of a large part of the earth's surface. Solar radiation is chiefly available in the two great though somewhat ill-defined dry belts north and south of the equator, running, for example, through Egypt and Arabia, across our own Southwest and far beyond the Pacific in a strip of continental Asia. In this area one can even now obtain a horsepower eight hours a day from about 100 sq. ft. (9.2 sq. m.) of mirror surface, a figure which can doubtless be improved. It should be noted, however, that the chief available source of solar energy lies in rather low latitudes and not in the regions which are now the centers of the world's activity. Again this condition points to the ultimate drift of population and of great civilizations to lower latitudes, to the regions where in fact the ancient empires grew and flourished before mankind drew upon the earth's stored fuel supply for warmth. One can well imagine such a drift, associated perhaps with marvelously developed north and south transportation to take advantage of the great fertile country during its annual period of usefulness.

Whatever there may be in such speculations, it is at least very plain from Dr. Steinmetz's figures that if our energy requirement goes on increasing for the next century at anything like the present rate, steps more radical than hydraulic development must be taken to keep pace with the world's needs. This does not, however, excuse mankind from failing to develop the resources of hydraulic power for all they are worth, thereby putting off the evil day in which the ultimate dilemma must be faced.

The Perennial Off-Peak Problem

THE central-station operator should read with keen interest James R. Cravath's consideration of the relation of the coal situation to the station loads. Next winter we are going to pass through a situation perhaps more serious than that of last winter. The zone system inaugurated by the Fuel Administration will help to a certain extent at the cost of relatively small inconvenience in burning unwonted kinds of fuel. It will not, however, remedy the shortage of coal due to lack of mine production and the difficulties of transportation, which are steadily increasing. The combined effect of war and fuel shortage has been to increase station loads very considerably, in fact, to an extent which keeps one guessing as to whence machine capacity can be derived. Almost the first effect of the increase in fuel costs has been to put a heavy handicap on small isolated plants, many of which were already, perhaps unwittingly, running at costs high compared with central-station service. Not a few of them have discovered the truth of the situation, and steadily more

and more isolated plants are shut down and their loads transferred to the general service available. We have more than once noted the desirability of meeting the difficulties of the situation by interconnection of public service companies on a large scale so as to take advantage of all the available aggregate capacity and of the total diversity factor.

Mr. Cravath lays special stress on the desirability of getting off-peak load both to increase the general efficiency of the station and to conserve machine capacity. Under present circumstances new equipment is both costly and difficult of attainment, and every possible effort should be made to utilize to the utmost both the generating capacity and the copper installed. This means coming to as nearly a full twenty-four-hour load as ingenuity can suggest. Mr. Cravath's hint as to taking over isolated-plant load through the summer is a good one where it can be applied. The main trouble is that not all systems have valleys in the load curves during the day, and it would mean additional load imposed upon the central stations through war conditions. Any off-peak scheme is practical and if properly handled will lead to prices of power so reasonable that in many instances it would pay the manufacturer to see if he could not arrange to work efficiently without calling for heavy power at the time of maximum peak. With the present tendency toward a general eight-hour day, this particular problem is somewhat simplified; but its solution is a task which belongs as much to the manufacturer as to the central station, and possibly the final effort will have to be made by the Fuel Administration. Certain it is that we are "up against" another season of shortage and must meet the situation thoughtfully and cheerfully.

Protection Against Flashovers

THE A. I. E. E. convention paper by J. J. Linebaugh and J. L. Burnham deals with a matter of particular importance in heavy railway service. Generators or synchronous converters of very large output are now and then exposed to most serious short-circuit conditions. If these are not too severe, the circuit breakers take care of the situation successfully, but there comes a time when even the brief short circuit permitted by the breaker is sufficient to cause arcing at the brushes which becomes continuous in a flashover. A great deal has been done to check this tendency by a strong commutating field, and with a considerable measure of success. Yet as machines have grown bigger and bigger, and as heavier and heavier demands have been put upon them, the dangers seem to have outrun the protec-

tion so far as this particular measure is concerned. The authors of the paper here considered set themselves the task of producing as complete protection against flashover as engineering skill could furnish, and they appear to have reached a degree of success that is most gratifying.

To a certain extent the tendency to flashover can be resisted by barriers between the brushes, just as it has been often checked in switches by a similar device. But this alone has never been fully successful, since in the case of very violent short circuits the arcing would get out of control even in the brief period required to get the ordinary circuit breaker into action. The line of improvement adopted by Messrs. Linebaugh and Burnham is twofold—first, to cut down to the utmost possible extent the time of operation of the circuit breaker, so that a flashover arc would have scant time to start, and, second, as an auxiliary measure, to furnish barriers to prevent arcing from brush to brush under the severest conditions of practice. Considering the fact that direct-current railway machinery is now built both for very high output and large voltage, the importance of these protective devices is self-evident. The authors, in fact, did a large part of their testing in connection with a 2000-kw., 3000-volt motor-generator set in railway service, which involves a constant threat of severe short circuit.

The chief form of improvement was directed to speeding up the circuit breakers to the utmost limit attainable. The ordinary big breaker begins to act in about 0.15 second, which is far too long a period of short circuit for safety against flashing. The authors therefore set out by careful mechanical design to get a very quick-acting breaker. As finally developed, it included a powerful spring actuating the relatively light moving parts, a tripping coil acting on a hair trigger, which opened the main trip on a movement of one-thousandth of an inch, and finally a series blow-out coil powerful enough to keep pace with the enormously rapid opening, reaching in fact under extreme conditions 150,000 ampere turns. By this ingenious combination it was possible to provide a high-capacity breaker which would open in rather less than a hundredth of a second. Even this speed was not quite sufficient to avert all danger with an open commutator, but the addition of a carefully designed set of barriers fulfilled all the requirements so that even the biggest generators could be adequately protected. The reader will find in this paper both many interesting details of the carrying out of the work and the results obtained by oscillograms and instantaneous photographs of the incipient arcing, as well as the data relating to miscellaneous researches of a highly promising character.

MUCH has been said about conservation of fuel by assuring efficient

combustion, but not enough attention has been directed to the benefits that can be derived from efficient utilization of the steam which is generated at the expense of coal. While turbines will maintain a high efficiency if properly cared for and operated, the steam economy will be greatly impaired if they are neglected. In a coming issue, therefore, the principal causes of impairment of economy will be discussed and suggestions given on how the trouble may be

The Coming Issues

detected and prevented in the future. Another article will refer to experiments which have been conducted with a lightning arrester that works on a different principle from those now in use. The instruction course that an Eastern university is giving to state inspectors on illumination requirements in industrial plants will be outlined, and in line with the general economies now practiced in central stations the method used by one company in economizing in poles and conductor expense will be described.

What Commissions Are Doing on Rates

Attitude of Various State Regulatory Bodies on Questions of Rate Increases Due to Higher Costs of Operation and Effect of War Conditions—Fuel and Labor Are Vital Points

This continues the series begun in the issue of June 8, 1918, showing the attitude of public service commissions on rates. It will be followed by other articles in later issues.

RATE cases which go before the state commissions under war conditions are extraordinary emergencies and are generally so recognized by the authorities. Under these circumstances the commissions appear to be disposed to minimize the usual preliminaries and requirements of costly and delayed appraisal and investigation and to grant relief without serious delay. Only by reducing the time of handling these cases can they in fact afford relief promptly. Any return to the old practice of devoting years to a rate case would fail to meet the emergency nature of the crisis.

POSITION OF NEW HAMPSHIRE COMMISSION

From the New Hampshire Public Service Commission a representative of the *ELECTRICAL WORLD* obtained the following:

Increased cost of operation is the basis of rate raises so far permitted by the commission, but in cases where other factors make an extended investigation necessary the mere fact of increase in operating cost might not in itself be sufficient to justify permitting the scheduled advance to go into effect.

Particular rate changes have been allowed to go into effect without the disapproval of the commission, and in general it may be said that each schedule is treated by itself, with due regard to the possibilities of discrimination against other users of service.

Since April 1, 1917, four increases in electrical rates have gone into effect; none has been rejected. Public hearings were held upon the cases of the Plymouth Electric Light Company and the Rockingham County Light & Power Company, Portsmouth, relative to increase in price to 20 cents per kilowatt-hour in the former instance and the establishment of a coal clause in the latter. The Twin State Gas & Electric Company, Dover, established a coal clause during the period (5 mills per kilowatt-hour, power only). There has been no general opposition to these rate changes except that the Plymouth case was heard at length. At present the commission has under consideration the schedule of the Rockingham County company for rate advance through service charge.

The Plymouth case was the only one since April 1, 1917, which required an extended investigation. It is not known at this date whether the proposed service charge of the Rockingham County company will be permitted to go into effect without investigation. This depends in large measure upon whether a statutory complaint arises relative to the proposed schedule prior to the expiration of the thirty days' period which must elapse after filing before the new rate may become effective.

Roughly, the increases in lighting and power rates are of the order of 10 per cent each, but it is difficult to state accurately the percentage advance in revenue

to be derived from rate changes, in view of the number of factors in rate structures to be taken into account.

Not over 7 or 8 per cent of the electrical utilities under the commission's supervision filed rate schedules looking toward increased revenue in the above period.

Predictions are uncertain, but in general it may be assumed that the commission looks upon the war as the dominant factor in present operating cost increases. Presumably there will be some recession of costs after the close of hostilities, but the commission is not disposed to set a limit to this recession more than to express its doubt as to the return of prices of fuel and labor to the ante-war levels.

VIEW TAKEN BY WYOMING COMMISSION

H. A. Floyd, secretary Wyoming Public Service Commission, says:

"In a few cases we have authorized electric utilities to increase rates on a showing of increased cost of operation where the operating cost had increased to such proportion that the utility was really suffering. In two different cases we have approved these increases for all classes of consumers. In two other cases we have permitted utilities to increase with their power consumers only.

"We have had within the past six months applications for rate increases from four electric utilities. In one of these utilities permission was granted to increase the rates approximately 10 per cent; in another case, where there had been competitive plants and a rate war, an advance of more than 200 per cent was allowed on general lighting consumers, about 25 per cent on cooking and electric appliances and more than 100 per cent on power consumers. The other two utilities were permitted to increase upon their power consumers, by and with the consent of the consumers, the increased cost of fuel amounting to between 10 and 25 per cent.

"About 10 per cent of the electrical utilities under our jurisdiction are seeking certain advances in their rates. From our study of the general conditions we are of the opinion that the situation at the present time is partially a war emergency, but that there may be a period of at least two or three years after the war before the situation will be as normal as it was in 1917 or previous years. The greatest difficulties which the electric utilities are encountering are the two items of fuel and labor—fuel having advanced in a number of cases as high as 400 per cent and labor advancing from 25 to 100 per cent. Under the latter item less efficiency is being secured with the advanced cost of labor than in previous years."

NEVADA LITTLE AFFECTED

F. O. Broili, chief engineer Public Service Commission of Nevada, sends the following in answer to our inquiry:

"Our State is a small one in the matter of number of

inhabitants. With that in mind we would answer your questions as follows:

"We have one case, that of a water company, before us for an increase in rates owing to decrease of the population in the community affected. We have made no decision as yet in the above case.

"We have received no application for increases in rates of electric utilities. We know of none that are contemplating asking higher rates. As practically all of the power here is produced from water-power plants, we do not feel that there will be any material change in the cost of power as far as this State is concerned, and such as is likely to develop in this State will probably be due largely to labor conditions, and this matter will probably adjust itself after the war."

APPLICATIONS IN UTAH

T. E. Banning, secretary Public Utilities Commission of Utah, writes:

"Increased rates are authorized upon a showing as to the increased cost of operation, where it is also shown that the public utility has not in the past earned in excess of a reasonable return upon the investment. No discrimination has been shown as between different classes of consumers. Where increases have been granted they have applied to all classes of service.

"Only six applications have been received for permission to increase electric rates within this State during the past fifteen months. Five applications have been granted and one is pending. Where increases have been granted utilities furnishing metered service, the increase has averaged 20 per cent. In one instance a change from flat to meter rate was authorized, and the minimum charge increased from 50 cents to \$1, or 100 per cent. No applications have been rejected. One application is pending before the commission. Approximately 10 per cent of electric utilities in this State are seeking higher rates.

"It is impossible at this time to state definitely whether increases granted and sought will become permanent or if they will be subject to deduction after conditions return to normal. Each case is handled solely upon its merits, and rates will be subject to review at a later date."

ACTION TAKEN IN MARYLAND

Benjamin T. Fendall, secretary Maryland Public Service Commission, writes to the ELECTRICAL WORLD:

"I am directed to advise that under the public service commission law this commission has no power to suspend the application of increased rate schedules pending investigation as to the reasonableness of the rates and charges therein contained, the only requirement in this respect being that the rate schedule be filed with the commission not less than thirty days before the effective date thereof. The utilities under the jurisdiction of the commission, therefore, formulate the schedules and file same with the commission, the schedule automatically becoming effective on date provided unless in the interim the commission should have conducted an investigation into the reasonableness of the increased rates and found same to be in violation of the law, in which case the commission must enter its order establishing reasonable rates for the future.

"Since Jan. 1, 1917, changes in the electric rates have been made by twenty utilities, which is about half the total number of electric companies under the jurisdic-

tion of this commission, and it is practically impossible to give you any estimate of the average increases that would be of any value to you whatsoever.

"Practically all of these utilities have increased their rates to all classes of users, the only exception being in the case of the Consolidated Gas, Electric Light & Power Company of Baltimore, which, of course, is a much larger one than any other electric utility in the State. The Consolidated company has not increased the rates for domestic service or for small commercial consumption but has added a fuel rate adjustment clause which is applicable to the larger users of the company's service.

"There has been no formal case filed with the commission respecting the reasonableness of any of the increased rates except in the case of the Consolidated company. Hearings in this case have been concluded, and the matter will be argued before the commission.

"The commission prefers not to hazard a guess as to whether or not the utilities will go back to their pre-war conditions in all respects upon the termination of the war."

APPLICATIONS IN INDIANA

Carl H. Mote, secretary Public Service Commission of Indiana, writes as follows:

"We have authorized a great many electrical utilities to increase their rates on a showing of increased cost of operation. This increase has been granted in the form of a surcharge without any disturbance of the permanent rate structure, and the surcharge is made to expire at a given date, say one or two years from the date granted. Generally speaking, increased rates for electric energy or surcharges have been applied at a flat rate upon power, though several increases have been authorized upon all schedules. The Merchants' Heat & Light Company of Indianapolis and the Indianapolis Light & Heat Company were authorized to add a surcharge of 5 mills per kilowatt-hour to all bills for light and power except bills for energy furnished to domestic consumers.

"The commission has granted approximately eighteen applications from electrical utilities to increase rates and has denied seven petitions of this character. No advance, I believe, has been greater than 5 mills, and the amount has ranged downward.

"Probably five or six petitions from electrical utilities have been filed quite recently which ask for increased rates.

"Every increase authorized by this commission since the declaration of war is made to expire at a given date or with the end of the war. We have no reason for believing that the general operating conditions of electrical utilities will be changed permanently by present conditions. In fact, increases have been authorized particularly on account of the increased cost of coal, labor and material, all of which are certain to recede at the close of the war.

"I may say that, in addition to the petitions heretofore referred to, the commission early last year received a petition from the Indiana Electric Light Association on behalf of its membership for authority to add a surcharge of 30 per cent to all bills for all kinds of service. This petition was dismissed, and the membership of the association were directed to file individual petitions which would be considered upon the individual merits of each petitioner."

COOSA RIVER STATION OF ALABAMA POWER COMPANY, FROM WHICH ELECTRICITY FOR NITRATE PLANT NO. 1 IS OBTAINED

Electricity for Government Nitrate Plants

Two Plants Now in Process of Erection in Alabama Will Have Steam Stations Pending Hydroelectric Development on the Tennessee River at Muscle Shoals

THERE are under construction near Sheffield, Ala., two government nitrate plants, one employing the synthetic process, the other the cyanamide process. While for years there has been a systematic effort made to have the government permit the development of the waters of the Tennessee River at Muscle Shoals for the purpose of manufacturing nitrates, nothing has been done and probably nothing will be done until after the war on any hydroelectric development there for nitrate purposes. Meanwhile the nation is engaged in war and has need of nitrates for munition purposes. The exigencies of the case therefore demanded the erection of steam stations for the supply of the necessary electricity, even though water-power sites exist in the vicinity. The accompanying map will give some idea of the size of the government reservations and their proximity to the proposed hydroelectric plants on the Tennessee River, one of which it is expected will be erected after the war. Three dams are contemplated: Dam No. 1 for purposes of navigation only and Dams Nos. 2 and 3 for the development of electricity.

Nitrate plant No. 1 now being constructed from an appropriation of \$20,000,000 will use a synthetic ammonia process. Part of the ammonia will be oxidized to nitric acid and the final product will be ammonium nitrate. The output in terms of nitric acid is to be 200,000 lb. a day, and the electricity will be supplied by the Alabama Power Company, which has a hydroelectric station on the Coosa River and an auxiliary steam sta-

tion near the mouth of a coal mine on the Warrior River.

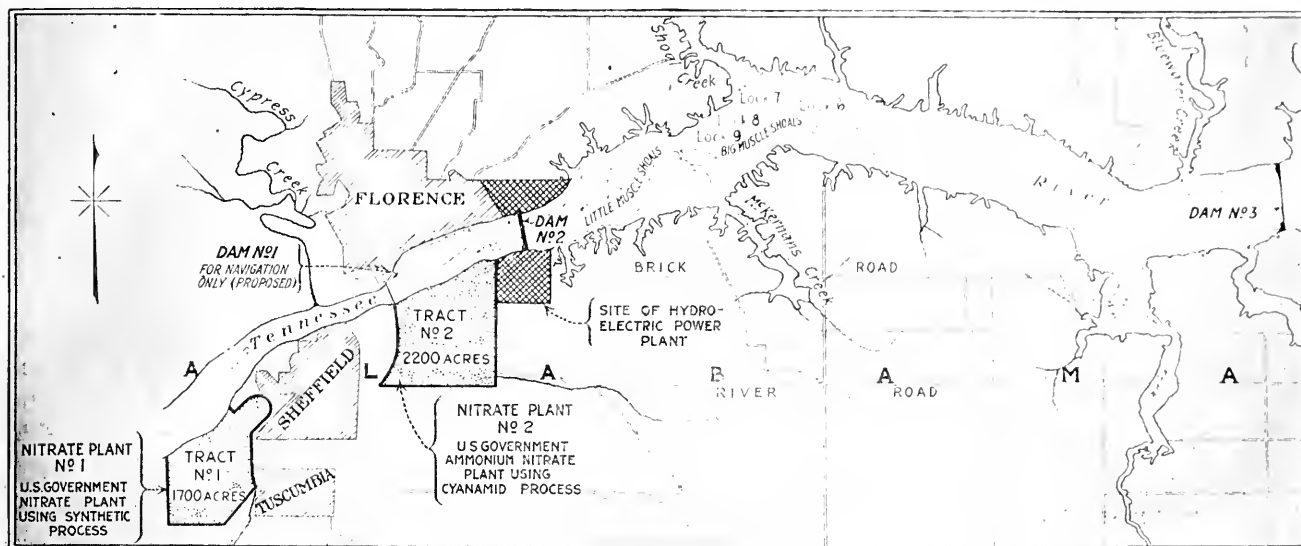

Nitrate plant No. 2 is being built by the Air Nitrates Corporation acting as agent of the Ordnance Department. The process used will be identical with that employed in the present plants of the American Cyanamid Company. The limekilns will burn 350,000 tons of lime per annum and the coke dryers will handle 100,000 tons. Carbide furnaces will fuse the lime and coke, after which the product will be cooled, ground and placed in ovens of one ton capacity, for treatment with nitrogen. The liquid-air plant for nitrogen production will have a greater capacity than that of all similar plants now existing in the United States and the Dominion of Canada.

The cyanamide, which contains from 20 to 21 per cent of nitrogen, will be cooled, ground, placed in autoclaves and treated with steam, to produce ammonia. In the cyanamide process this gas when mixed with air is passed through a heated platinum screen, whence the nitrogen is oxidized by catalysis. The oxide gases are then cooled and absorbed. One-half of the ammonia produced in the autoclaves will be thus oxidized and combined with the rest of the ammonia for the production of ammonium nitrate. The power requirements will be 60,000 kw., to be supplied from a steam turbo-generator station erected at the plant. Electricity from this steam station will, however, be superseded by electricity from a hydroelectric plant to be erected subsequently at Muscle Shoals.

The government, in addition, has under contemplation the erection of two other nitrate plants in Ohio, one at Elizabethtown and the other at Toledo. Both plants combined will have an output equal to Nitrate

power requirements will be met by existing central stations in the vicinity.

It is of interest to note in this connection that the steam turbines required by the government for its vari-

MAP OF GOVERNMENT NITRATE-PLANT RESERVATIONS AT MUSCLE SHOALS, ALA.

Plant No. 2, located at Muscle Shoals in Alabama. While no definite decision has yet been made relative to the Ohio plants, it is generally understood that the

ous nitrate and munition plants have been commandeered from the central stations of the country, the government to substitute other units for those taken.

Relation of Coal Situation to Central-Station Load

Off-Peak Service with Attractive Rates Is Urged for Those Isolated-Plant Customers That Are Forced Through Fuel Conditions to Take Electric Energy Supply from Power Company

BY J. R. CRAVATH

NO CENTRAL-STATION man needs to be told that the present coal situation is having a very strong tendency to build up central-station load. The load is coming fast enough; in fact, too fast. The central-station manager is in much the same position as a cautious man learning to run an automobile. He is concerned not so much with keeping the thing moving as with how to steer and control the "gol-durned thing" so that it will not run away with him and cause a wreck. The question is how to handle the additional load with minimum investment and plant extension rather than how to get the load.

Before attempting to discuss the best ways of handling the load which is being thrown upon central stations as a result of the present coal situation a few words as to how and why the load is coming are in order. The increase in coal prices since the beginning of the war has tended to make central-station power more economical than power generated in small plants, where before the balance was about even or in favor of the small plant. This is because the cost of fuel is usually a much larger percentage of the total cost of power in a small plant than in a large economically managed central station. For example, a 10 per cent increase in coal prices means more to a small plant where the coal cost is 50 per cent of the total than in a cen-

tral station where the coal cost is, say, 10 per cent of the total. This is given merely as an example to illustrate the point and not as any average figure for isolated versus central-station plant economy. In this connection it must be remembered that difference in pounds of coal required per kilowatt-hour in the two plants is not necessarily a measure of the difference in fuel costs, as the small plant frequently has to burn more expensive fuel, so that the difference in coal costs per kilowatt-hour is considerably more than the difference in plant performance.

The uncertainty of coal supply throughout the winter and the absence of storage facilities also tend strongly to make the isolated-plant owner seek central-station power. Many isolated plants are not so situated that they can maintain adequate storage to tide over winter months, and they are faced with the possibility of a worse coal famine than last winter. Even where storage can be used, the cost of putting coal in and out of storage materially runs up the total coal cost and acts as the equivalent of an advance in price.

The zoning system of the United States Fuel Administration whereby the plants in any given locality will be required to use coal from mines nearest to that locality and save long shipment will force some plants to use a lower grade of fuel than formerly. As much of

the high grade smokeless fuel has been used for domestic purposes rather than steam-plant purposes through the Middle West, this new system will not affect central-station loads as much as the reduction in coal tonnage shipped might indicate. The principal use of anthracite and high-grade West Virginia smokeless coal through the Middle West has been by small domestic consumers and by large buildings in big cities. As these buildings will have to have heat in any event, they will be obliged to equip to burn whatever fuel they can get, and therefore the influence that the change will exert on the power load is somewhat in doubt as yet.

The general principles which should be followed by central-station companies in meeting this increasing load situation are simple. The added load should be kept off of the present peak-load period as much as possible. Make existing apparatus carry this new load to as great an extent as may be and save investment in additional plant. The interests of the company's stockholders and of the United States are identical in this respect, because saving in central-station investment means saving in men and materials much needed elsewhere for war purposes.

In the past central stations have made special off-peak rates, but inertia and dislike to change established customs have prevented many customers from taking advantage of these, even though there may have been no real good reason why they should not. These war times are helping us to pull ourselves out of many bad ruts of conservatism, and now of all times would seem to be the opportunity to advance the off-peak load idea more fully than ever before.

THE OLD QUESTION OF THE OFF-PEAK LOAD

This brings us around to the old question of what classes of load can be made off-peak. The taking over of an isolated plant furnishing lighting—for instance, for office or apartment buildings—offers an opportunity for off-peak load only in the way already indicated as having been adopted by some large buildings. This is to throw the entire power and lighting load onto the central station during the summer time. By allowing the central station to carry the load at all times except during the prohibited peak period the isolated-plant owner can make a very material reduction in fuel consumed even if his plant cannot be entirely shut down.

Where the isolated plant to be shut down is one operating an industry which does not have to run twenty-four hours per day the periods of shut-down for that industry can be regulated, prejudice and custom to the contrary notwithstanding. Public service commissions in the past have usually required public utility companies to give services wherever demanded, if given according to the rules of the commission. Were an industry to demand central-station power and insist upon taking it during peak period, paying the regular rate therefor, the central station could not, under past rulings, refuse it. However, it will not do to assume that customers will insist on regular peak power where it is not absolutely necessary for them, or that regulating commissions will not recognize the present special war conditions and require some concession on the customer's part where this is feasible.

The analysis of the operating and investment costs necessary to make a proper off-peak rate should have been made by every central station before this, but if

not, now is the time, if ever, to make this analysis.

The first thing in such a study is to determine what is the real peak which it is desirable to avoid. It is also necessary to consider whether this peak is likely to be shifted by conditions of the immediate future. In determining what is the peak which is to be avoided a good criterion is to see whether the cutting off of any given peak would result in a lessening of the total station capacity required to supply the load on the system. On systems where the peak is of short duration during the maximum months of November and December a schedule which would call for the shutting off of off-peak power only a few hours per year might make possible carrying considerable additional connected load. One must always remember, however, that the tendency of central-station load is toward broader peaks as the diversity of load increases. If care is not taken in formulating the off-peak hours, the off-peak load itself may sooner or later contribute to a broadened peak. One must look ahead to these possibilities in establishing an off-peak schedule.

The investment required to supply an off-peak load as compared to a peak load involves an analysis of the extra investment required to supply an off-peak load over and above the investment if the off-peak load were not there.

Beginning at the consumer's end of the distribution system, the meter and service wire investment is the same for an off-peak as for a peak load customer of a given size. The transformers on an alternating-current system may be usable both for peak and off-peak customers, but in the case of large power customers frequently this transformer investment is peculiar to the individual customer, just as are the service connections and feeders. Feeders will usually be usable by both classes of customers, the same being true of substations and transmission lines. Of course, no two consumers are situated exactly alike, and it is necessary to strike some kind of an average just as in making other rates. The power-station equipment is obviously usable by both classes of customers.

This brings us to a rather fine point in rate making, which is whether the off-peak customer should pay part of the fixed charges on investment which is needed anyway to serve the regular peak customer. On one side is the argument that the addition of the off-peak customer does not add to the company's investment in certain items and therefore the off-peak customer should not be charged with it. On the other side is the argument that since both the off-peak and the peak customer enjoy the benefits of the investment it should be in some way divided between them, though by no stretch of the imagination could it be justly claimed that an off-peak customer should pay as much per kilowatt of maximum demand as a peak-load customer. If the principle of making rates according to true costs is followed, the off-peak customer will evidently have to pay a portion of the fixed charges on the investment required to serve him and the peak-load customer will have to pay a similar portion and in addition all of the fixed charges on the special peak-load investment required to serve him. To state the matter in another way, below a certain load-curve line the investment charges would be divided between these classes of customers, and above that line the investment would be chargeable altogether to the peak load customer.

"WASTEFUL DELIVERY METHODS CAN NO LONGER BE TOLERATED. SHORT-HAUL, MANY-STOP DELIVERIES ARE THE FIELD OF THE ELECTRIC TRUCK. EIGHTY-FIVE PER CENT OF CITY HAULAGE CAN BE ACCOMPLISHED BY THE ELECTRIC VEHICLE"

The Electric Vehicle as a War Measure

Offering an Economical Solution for an Important Part of the Nation's Big Transportation Problem, It Presents an Opportunity to the Central-Station Industry of Which Every Advantage Should Be Taken

BY JAMES H. MCGRAW

This address was made by Mr. McGraw at the Atlantic City convention of the National Electric Light Association, June 14.

TRANSPORTATION is one of the vital problems of the day. It deserves the attention of the biggest men in every industry. War has enormously increased congestion in factories, on railroads, in warehouses and terminal yards and on our city streets. We have more raw materials and more products to handle with fewer men, and with the need for real economy in handling costs.

More minds are being concentrated on transportation than ever before. Government officials, Washington bureaus, the War and Navy Departments, as well as engineers, central-station men, electrical engineers in industrial plants—all are considering parts of the problem.

TRANSPORTATION CONDITIONS

A brief survey of transportation problems in this country brings striking facts to light. Forty-five per cent of the population live in 11 per cent of the area of the United States. This restricted area includes the New England States, New York, Pennsylvania, New Jersey, Maryland, Ohio, Indiana and parts of Illinois and Michigan.

Of all goods made in the United States, approximately 70 per cent are made in this area. This concentration of population and manufacturing brings naturally a congestion of traffic that is little realized until a tremendously added burden is put on it by war needs.

Within the congested area is a still smaller zone which to-day is the red-flag zone of the government departments. In this zone, which borders the Atlantic and extends from Baltimore to Maine, there are no raw materials, no bituminous coal, no iron or other basic supplies. To get these raw materials into this region they must go through four gateways—Williamsport, Altoona, Shippensburg and Baltimore. To get coal and basic supplies into the great manufacturing district of New England, where there are so many war plants,

there are three gateways—the Harlem River, Poughkeepsie and Albany.

We must win this war with our present main equipment. We haven't time to build more gateways, more railroads, more trunk lines. The so-called red flag zone the next year will require 90,000,000 tons of bituminous coal, 80,000,000 tons of hard coal. All this product must go through the four gateways.

What does this mean? Broadly, it means that we must concentrate our attention on auxiliary means of transportation to move goods faster and transfer goods more quickly at this point. Every freight car must count. According to lately gathered statistics, we need 150,000 cars for replacement alone. The government ordered 100,000—a tremendous order, it is true, but only a part of what is needed to handle materials.

Electricity offers three means of auxiliary aid to the steam railway freight problem at this time. Various classes of hoists and transfer cranes and platforms operated by electricity are in use. Second, there is the industrial electric truck, a low-body, small-wheel vehicle which is being used for transfer work in government yards, docks and terminals, munition factories and so forth, and third, commercial electric trucks for short-haul, many-stop deliveries from warehouse to merchant, from merchant to customer.

In all these fields the electric vehicle is now performing work of direct help in war service, and there is a very real opportunity to extend this development tremendously.

Electric industrial trucks are being used more extensively than is generally realized in direct government work. Hundreds of trucks are in use at embarkation and debarkation points. Practically all goods going into France are handled at some point by electric trucks. Special trucks with crane and hoist attachments have been developed. Because of the nature of the work, it is not possible to describe these applications in detail.

The average cost of operating an electric industrial truck of this kind, including tires, battery upkeep, mechanical repairs, charging, drivers' wages and in-

terest on investment, is between \$5 and \$6 a day. In many instances one truck will do the work of four to six men. In one instance a truck saved eighteen men a day. These trucks have a speed of 5 miles (8 km.) an hour loaded and a capacity of two tons. They are particularly serviceable in operating in munitions factories because the risk of fire is practically negligible. These trucks are being built by hundreds. There are estimated to be 5000 in use to-day.

Specialized electric trucks for government service have also been built for hospital supply wagons and ambulances at base hospitals. An electric kitchen wagon also has been built. Electric tractors are in operation at the navy yards and supply depots for hauling ammunition cars.

WAREHOUSE AND TERMINAL HANDLING OFFER CHANCE

The war has especially shown the inefficiency of our methods of handling goods out of cars, across platforms and into warehouses. Goods are handled and re-handled without regard to time or labor. This is one of the biggest parts of our transportation problem.

It should be a matter of pride to realize that electricity at the terminals and gateways is helping to move goods more cheaply and faster. The industrial electric truck, the electrically driven overhead crane, the hoist and telfer systems operated by electricity, the night illumination, are all factors in this problem.

Electricity is helping to get the job done, and the demand for the industrial electric truck for this work is ahead of the supply, although the trucks are being turned out by several manufacturers. For loading and unloading steamships the electric industrial truck has found a place, not only because it saves time and labor but because practically every other type of power vehicle is eliminated from both docks and steamships by insurance companies on account of fire risks.

ELECTRIC TRUCKS IN MUNITION AND OTHER FACTORIES

Industrial electric trucks are helping to get work done in munition factories and arsenals. They have revolutionized the methods of handling goods in many plants. These factories need to-day to increase output by every possible means. They also need to conserve men, both laborers and mechanics. The industrial electric truck replaces men, speeds up production and is so simple a mechanism that it requires little skilled attention.

As a concrete example of what an industrial truck will do the Packard Motor Car Company has three electric industrial trucks handling scrap material from the lathes and presses where formerly forty-eight men were required.

Electric transportation in the factory is simply another example of the widening use of electricity in industries. Central-station service and the motor drive have been adopted. The power engineer from the central station has had an opportunity to act as an electric engineer of transportation and to point out to the factory manager just what electricity can do for transportation to his factory.

Local delivery methods are getting the same overhauling as railway, terminal and factory systems. Men are growing scarcer. Wasteful delivery methods can no longer be tolerated. The problem is part of the complete city transportation needs.

The Commercial Economy Board of the Council of National Defense has just issued a booklet entitled "Economy in Retail Service." The Council of National Defense as a whole also has made this statement: "The Council of National Defense has given its formal approval to all measures designed to facilitate the use of motor trucks in transportation wherever they can be utilized. It is urging all communities as far as possible to adapt the motor truck to their local needs and encourage its use in any way to help existing transportation problems." In neither of these pronouncements is direct reference made to any type of motor truck, but the general idea of replacing horse-drawn trucks and, perhaps more important, antiquated delivery systems is being widely promoted.

The booklet issued by the Commercial Economy Board is part of a broad program started in 1917 to show how economies introduced by voluntary co-operation of business would release men, materials, equipment and capital for carrying on the war. The work in retail deliveries was undertaken primarily to conserve labor, to make it unnecessary for merchants who lost delivery men through the draft and other war causes to replace them out of supplies available for shipbuilding, farming, railway transportation and other war work. A careful survey of the whole country was made among retail and wholesale merchants.

Several of the findings of this survey point particularly to present opportunities for the electric vehicle to meet the problem of local delivery under war conditions. In Massachusetts it was found that 5230 stores, about half in the State, operated 4473 vehicles. Of these, 3129 were horse-drawn and 1344 were motor trucks. This general proportion of horse-drawn and motor-propelled trucks holds for the country.

A second point in this general investigation worth the attention of the electrical industry is the relative importance of this transportation cost as an element in the merchant's total cost. In the city of Washington the delivery costs for bakery products averaged 19.8 per cent of gross sales; for dairy products, 12.1 per cent; for ice cream, 14.9 per cent; for coal and wood, 15.2 per cent; for ice, 45.6 per cent, and for food products, as a whole, 7.4 per cent.

SHORT-HAUL, MANY-STOP DELIVERIES THE FIELD

The report contains definite suggestions for changing the methods of delivery. It points out that short-haul, many-stop deliveries generally provide the best service to the customer, and it suggests plans for working out such systems. This, of course, is the ideal field for the electric vehicle. Ninety-five per cent of the work done by horses on the street can be done by motor trucks. Eighty-five per cent of the city haulage can be accomplished by the electric vehicle. Figures compiled many times show the inherent economy of the electric used in place of the horse-drawn wagon. A light truck will move a single-horse wagonload of goods a mile for 1 cent (energy at 3 cents per kilowatt-hour). Gasoline for that same mile would cost 3 cents and oats for the horse 5 cents. And this is only one element in the cost.

All of the coal used in the Hudson Terminal Building in New York City is hauled from Jersey City by two 5-ton electric trucks. By hauling the coal from storage and buying in large volume, the company saves \$45

per day. The ferry charges were reduced several dollars a day because the electric truck for the same capacity was about three feet shorter than a gas truck and so came in a lower class. The cost of handling fuel is one of the elements in our fuel supply that are receiving careful analysis. The electric truck with a suitably adapted body is an economical solution of the problem. In one case now being investigated one 5-ton truck with different detachable bodies could replace both horse-drawn and gas equipment, eliminate surplus equipment and effect a saving of about 35 per cent to 40 per cent.

I have briefly summarized the way in which electricity is a part of the transportation problem to-day.

GENERAL ADVANTAGES

The general advantages of the electric vehicle as a part of the big transportation problem may be summarized as follows:

Manufacture. — Simplicity of design, requiring few parts; almost total absence of machined steel in power plant; need of skilled mechanics reduced to a minimum.

Operation. — Skilled mechanics unnecessary; young and old, men and women, are successful operators.

Maintenance. — Few parts and absence of reciprocating features assure maximum uninterrupted service with minimum supervision and repair, thus releasing skilled mechanics for more vital war work.

Operating Costs. — Lowest for work accomplished of all forms of mobile transportation.

Fuel.—Energy for battery charging taken off-peak.

Conditions abroad are not the same as in this country. We are not yet faced with the drastic shortages in liquid fuel and operators that have faced our Allies. The fact remains, however, that the electric vehicle has filled a very definite place in the transportation development abroad. For example, there have been six times as many "electrics" put into service in England alone during the last three years as in all the time before. Electric vehicles have been adopted for han-

dling municipal work, for example, in eighteen towns and cities, for garbage collection, road construction, street cleaning and coal deliveries. The Midland Railway has about 110 electric trucks in service, and the Great Northern Railway has eight 3½-ton trucks. American electric trucks displaced the entire horse unit in Leeds, thirty-three horses and sixteen vans.

The Electric Vehicle Section of this association has been working with the French High Commission in New York looking forward to the manufacture of the electric vehicle in France as a part of the great problem of reconstruction and water-power development under way in that country.

Norway is to-day an active market for the electric vehicle, both commercial and pleasure cars.

CENTRAL STATION'S RÔLE

This discussion has been undertaken to bring before this association, not the detail economies of the electric vehicle, which are well known, but the opportunity that the central stations of the country have to aid the government by taking an active part in helping to solve the transportation problem as a whole. The central stations to-day are furnishing light, heat and power to meet war needs and to conserve men and materials in the commercial and domestic life of the nation.

The transportation problem needs the attention of our biggest electrical men. Transportation to-day is handled with tremendous losses. The movement of freight to-day is a transportation engineering question. As an engineering question the electrical industry

will play a large part in solving it. The supply of electricity for the big developments to come, in cheapening the cost of handling goods in terminals and warehouses and in cutting the cost of deliveries on our city streets, is worth the attention of every central station in the nation.

The electric vehicle to-day offers an economical solution for an important part of our big transportation problem.

THE ELECTRIC VEHICLE COMING INTO ITS OWN

The electric vehicle is classifying itself, coming to its own, by a situation that is brought about not by the vehicle itself but by national economics. This is a time when the thought of the nation is concentrated on the cost of distribution. Our cost of distribution when compared with the cost of production has been extraordinarily wasteful. Undoubtedly the electric vehicle promises to play a large part in the solution of our terminal problems. These problems to-day are of the greatest national importance, and when the victory is won we shall need still more the best of terminal facilities to develop and carry on the stupendous international trade with which we hope to be overwhelmed.

The port of New York cannot liberate itself with sufficient rapidity. We have streets filled with horse trucks, and inefficient methods of getting materials away from terminals. There is a clinker in the grates of the transportation problem. We must devise means of getting rid of it so as to keep a lively draft and keep up circulation.

In my judgment, looking at it in its broadest aspect, I believe the key to the solution of this problem and the clearing up of the terminal condition lies in the electric vehicle.—*From the discussion of "The Electric Vehicle as a War Measure," by J. W. Lieb, Past-president of the N. E. L. A.*

Power Factor and the War

Present Conditions All Over the Country Due to the National Emergency, Make It More than Ever Essential to Obtain Maximum Use from Equipment
One Way Is to Improve Power Factor

BY WILL BROWN

Electric Machinery Company, Minneapolis, Minn.

CENTRAL-STATION companies formerly avoided discussing the subject of power factor because it involved some complications in rates and metering. But "times change and men change with them." We are at war. Waste must be eliminated.

The cost of transmission lines is greatly increased by low power factor. For example, the number of pounds

FIG. 1—MORE USELESS THAN USEFUL CURRENT CIRCULATES WITH 70 PER CENT POWER FACTOR

As a result larger conductors and switching equipment are required, the apparatus supplying energy must be larger, and maintenance of constant voltage is more difficult.

of copper required on a transmission system operating at 70 per cent power factor is at least 33 per cent more than is required if the system operates at 90 per cent power factor; but very often the nearest standard-size wire (or gage) may considerably exceed the exact requirements (in circular mils). Thus the percentage of cost may be largely increased, in some cases to the extent of 60 per cent. That is, if the system at 90 per cent power factor requires 100,000 lb. (43,360 kg.) of copper, the system at 70 per cent power factor requires 159,000 lb. (72,120 kg.) of copper, it being understood that both are 60-cycle systems with the same line drops, operating at full capacity and carrying the same rated kw. load. Think of it! Nearly 60 per cent more copper used to carry reactive current.

One can go further into this matter of waste caused by low power factor by considering the two systems compared below, each having 3000 kw. in motors. System A operates at a power factor of 90 per cent lagging (3333 kva.), whereas system B operates at a power factor of 70 per cent lagging (4285 kva.). Both deliver the same power, viz., 3000 kw. The initial costs of the two systems are as follows:

	System A	System B
Generators*	\$34,200	\$44,100
Transmission lines	45,000	72,000
Transforming and switching equipment	7,000	9,250
Motors, etc.	35,400	35,400
Total	\$121,600	\$160,750

*Prime movers not included.

Nearly \$40,000 worth of additional equipment must be installed to enable system B to operate at 70 per cent power factor and still carry the same kw. load as system A at 90 per cent; and this is by no means all the waste involved, for there is a constant loss due to greater heating caused by the low power factor.

The proper use of synchronous motors—that is, for the type of duty for which they are adapted—will go a long way toward relieving conditions of low power factor. Synchronous motors for power-factor correction should be installed as near as possible to the causes of lagging power factor. The reactive current then circulates between the induction motors and the synchronous motors only, and the generators and distributing lines are relieved thereof.

There is another way of looking at the value of improving power factor which should be particularly interesting at this time, and that is that larger loads can be carried without increasing the generating, transforming or distribution facilities if the power factor is raised. This may afford the quickest way of providing for increased production since it does not involve the purchase, delivery or installation of a large amount of equipment. As an example of what can be done along this line attention may be called to one plant which was operating at an average power factor of 72 per cent lagging and which was driving about 1400 hp. of induction motors of various sizes ranging from 1 hp. to 200 hp. It became absolutely necessary that a large motor be added to the line for driving a compressor. The alternators were already loaded to the safe overload capacity. A 500-kva. synchronous motor was added to the system to drive the compressor (about 280 hp.). By overexciting the motor so it would run at a power factor of 42 per cent leading it was possible to raise the power factor of the system to approximately 90 per cent. The same alternators are now driving the original 1400 hp. of motors plus the 280 hp. used for the compressor and are actually generating less kva.

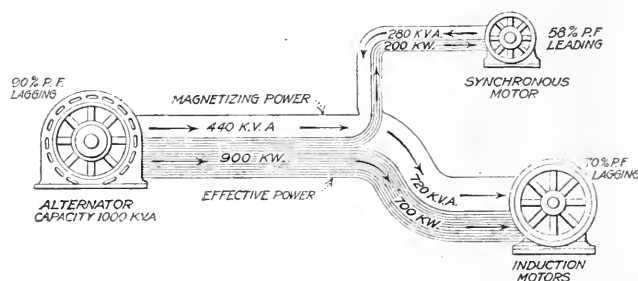

FIG. 2—MIXING SYNCHRONOUS APPARATUS WITH INDUCTION MOTORS REDUCES USELESS CIRCULATING CURRENT

The synchronous equipment can also carry load and permits using smaller conductors, switches, etc., or at least allows using the reserve capacity for other purposes. Reserve capacity is also released in the energy-supply apparatus.

than before. Under the new conditions it requires only 1400 kva. at 90 per cent power factor to serve nearly 300 hp. more equipment than under the former condition when the alternators were delivering 1460 kva. at 72 per cent power factor. (See Fig. 1.)

Serving war industries has brought many problems to central-station companies, since munition factories are

almost invariably bad offenders as regards production of low power factor. For instance, one of the large government arsenals has a generating plant of its own with a capacity of about 8000 kva. In addition to this it also receives power from the local central-station company. The present power factor at the switchboard is about 70 per cent to 75 per cent lagging. A new ordnance factory is about to be added, known as the "field and siege plant." This new plant will be equipped with 4000 kw. of induction motors, but the average power required of these motors when they are all running will probably not exceed 1500 kw. This will mean very poor power factor, possibly 55 per cent to 60 per cent lagging or even lower. Consequently there will be a serious problem for the central-station company unless something is done to raise the power factor of the government plant. To correct the conditions the plant engineers are considering using synchronous motors of relatively large kva. capacity to drive a number

Rubber factories as a rule suffer from poor power factor, caused by many large induction motors running at part loads. It seems reasonable to believe that in the near future synchronous motors will be quite widely used for rubber-mill drive. This will increase the efficiency of the entire plant and remove the necessity for large condensers. Some form of magnetic clutch is necessary both for starting and for safety reasons. Already there are a number of installations of this kind, and synchronous motors are proving their ability to handle the large fluctuating loads on the line shafts in rubber mills.

A certain rubber company obtains a rate from the central station based on a maximum demand of approximately 8000 kw. at a power factor of 90 per cent. Should this power factor drop to 70 per cent, the rubber company is penalized at the rate of \$1 per kilowatt per year on the maximum demand for that month. In order to maintain power factor at 90 per cent the company has installed two condenser sets with a rating of 2000 kva. each.

WHEN TO USE A SYNCHRONOUS MOTOR

Wherever a large, constant-speed load is to be driven the very first question asked should be: "Can a synchronous motor be used to drive this load?" If starting and running conditions are such that this is possible, the question ought to be answered in favor of the synchronous motor. The matter should be viewed both from the standpoint of motor efficiency and also from the broader viewpoint of overhead cost for delivering power. Following is a typical case as outlined by a prominent central-station manager.

A centrifugal pump requiring 400 hp. and with a speed of approximately 600 r.p.m. was to be driven by an alternating-current motor. There were to be a number of other smaller motors at this plant. If a 400-hp. induction motor was installed, it was estimated that the average power factor of the load would be 70 per cent lagging. The average power factor of the load with a 400-hp. synchronous motor driving the pump would be over 90 per cent power factor. The comparative efficiency of the two motors was considerably in favor of the synchronous unit.

The following table shows that nearly \$14,000 more initial investment* would have been required of the central-station company to serve the load if the 400-hp. induction motor had been installed than was necessary with the synchronous motor installed:

Transformer substation	\$430.00
2300-volt service	215.00
13,000-volt distributing system.....	1,806.00
Step-down substation (50,000 volts to 13,200 volts)....	774.00
Transmission lines, 50,000 volts.....	8,600.00
Step-up transformers, 13,200 volts to 50,000 volts.....	774.00
Generators	1,290.00
Total	\$13,889.00

On a basis of 10 per cent for interest and depreciation this would mean an annual charge of \$1,389 against the induction motor when compared with the synchronous motor.

Under the conditions the central-station company absolutely refused to furnish power for this load unless a synchronous motor was used.

The writer recently sent out a questionnaire to many central-station companies furnishing power loads in

*Based on total kilovolt-amperes required with both arrangements.

FIG. 1—VECTOR DIAGRAM SHOWING EFFECT OF RAISING POWER FACTOR FROM 72 PER CENT TO 90 PER CENT BY SYNCHRONOUS MOTOR

The synchronous motor rated at 500 kva. is delivering 210 kw. of mechanical power at the same time that it is correcting the power factor of the system. The original system was delivering 1460 kva. of which only 1350 kw. was being used usefully for mechanical power. After the addition of the synchronous motor the system delivered 1260 kw. of mechanical power, while the apparent kva. was reduced from 1460 to 1400. By similar diagram any one can figure the size of the synchronous condensers required to produce the desired power factor on his lines. It can be seen by the diagram that it rarely pays to raise the power factor above 90 per cent as the amount of condenser capacity required is very large in proportion to the increase of effective kw. which can be secured.

of air compressors which are to be installed. No doubt one or more other synchronous condensers will be necessary.

The reason why the induction motors are so much too large for their work is primarily found in the fact that the motor voltage is 550, which is an unusual voltage for induction motors, so that it was difficult to find in stock the right size motor for each purpose. The buyers picked up motors where they could find them, often taking a 50-hp. motor where one of 25 hp. would have been sufficient for the load.

From an engineering viewpoint it is much better to buy a motor just large enough for its average load, and if in the future it should be necessary to drive a heavier load, the old motor can be replaced with one of larger rating. Much money can be saved by such practice in the first cost of the motor, the higher efficiencies secured, and from the standpoint of generating and delivering power.

manufacturing districts, and it was really startling to see how rapidly changes were being made in regard to power-factor regulation.

One large manufacturing company near Chicago which is a large user of power received a bonus for one month of more than \$1,300 as a result of maintaining a power factor better than 95 per cent. In contrast to this, a rather small company using power was penalized \$1,900 last year for low power factor. It is interesting to note that this concern was operating a motor-generator set consisting of a 150-hp. induction motor driving a direct-current generator. Owing to the fact that the maximum load of the generator was never more than 40 kw. or 50 kw. and generally much less than this, the power factor on this induction motor was very poor. If this had been a synchronous motor of similar rating operated at its full kva. capacity, the power factor of the interior system would have been so raised that there would have been no penalty imposed. Thus in one year's time a saving of \$1,900 would have been effected, or more than enough to pay for the motor.

One of the large power companies in Ohio has the following clause in its contract:

When the current supply is alternating and the greater part of the load is power and the billing demand exceeds 75 kw., the company reserves the right to test the power factor of the consumer's load, and if the average power factor is greater than 75 per cent, then the demand shall be reduced in accordance with the following formula: Billing demand = kilowatt demand as measured \div average per cent power factor \times 75.

If the average power factor is less than 60 per cent, then the demand shall be increased in accordance with the following formula: Billing demand = kilowatt demand as measured \div average per cent power factor \times 60.

The company will make without charge a power-factor test at the consumer's request once a year, if his demand exceeds 75 kw. By power factor is meant the average power factor under normal operating conditions.

A number of companies in Illinois operating under the Illinois Public Utilities Commission incorporate the following clause in power contracts:

"Should the power factor fall below 80 per cent, the energy as metered shall, for billing purposes, be subject to an increase in the ratio of 80 per cent to the actual power factor as used."

The following clause is quoted from an Indiana company's contract:

"The primary charges will be increased by 1 per cent for each 1 per cent the power factor on the entire load decreases below 75 per cent at any time."

THIS war is one of nations—not of armies—and all of our 100,000,000 people must be economically and industrially adjusted to war conditions if this nation is to play its full part in the conflict. The problem before us is not primarily a financial problem, but rather a problem of increased production of war essentials and the saving of the materials and the labor necessary for the support and equipment of our army and navy.

—Woodrow Wilson.

SUDDEN SHORT CIRCUITS OF A.-C. GENERATORS

Mathematical Notes That Supplement the Derivations and Explanations Given in Previous "Electrical World" Articles on This Subject

BY N. S. DIAMANT

FOR the benefit of operating or designing engineers interested in actual quantitative results and detailed derivations regarding sudden short circuits of alternators, the following notes are given:

Derivation of equation (1), ELECTRICAL WORLD, May 18, 1918, page 1028: See footnote (4) and *Transactions A. I. E. E.*, Vol. 34, equations (3), (4) and (5).

Derivation of equations (2) and (3), page 1029, follows from the solution of:

$$M i_1 \sin \omega t + M i_2 \sin [\omega t - (2\pi/3)] + M i_3 \sin [\omega t - (4\pi/3)] + L_f i_f = N_f [\Phi_{fsc} + (\Phi_f - \Phi_{fsc}) e^{-a_f(t-t_1)}] \quad (10)$$

$$M i_1 \sin \omega t + L_a i_1 = (N_a \Phi_a \sin \omega t) e^{-a_a(t-t_1)} \quad (11)$$

and two other expressions similar to (11) for the other phases, where $\omega t = 0$, $\omega t_1 = 0$, $i_f =$ (unknown) field current, $i_1, i_2, i_3 =$ (unknown) armature phase currents, $a_f, a_a =$ attenuation factors of field and armature respectively, $L, M =$ self and mutual inductance respectively.

After some algebraic transformations and the substitutions given below, equations (2) and (3) are obtained. $\lambda_f = L_f - (3/2 \times M^2/L_a) =$ total leakage inductance reduced to field.

$N_f \Phi_f = L_f I_f =$ total field flux.

$$D = (L_f - \lambda_f)/\lambda_f = (L_a - \lambda_a)/\lambda_a.$$

For further details as to the algebraic procedure see May 18 issue, pages 1028-1032, and June 1 issue, pages 1126-1129.

Boucherot's "memoire" should be consulted where single-phase and two-phase alternators are considered. The three-phase sudden short-circuit equations are given by the writer for the first time in the ELECTRICAL WORLD and involve certain assumptions, such as that the mutual inductance between phases is negligible and that the sustained short-circuit armature flux = Φ_{assc} , is zero, etc. The reader will see the reason for these and appreciate their relative importance by going through the mathematical derivation for himself. If $\Phi_{assc} = 0$, i_f is given by (2) as before plus the following terms:

$$- (\lambda_a/M) \{ D - D e^{-a_a(t-t_1)} \} I_{ssc},$$

which are clearly negligible.

As stated before, single-phase sudden short circuits between line and line or line and neutral present certain peculiarities. Boucherot gives the following equations for the armature and field currents for a machine without amortisseur winding:

$$i_a = I_{ssc} \left[\cos \theta_1 e^{-a_a(\theta - \theta_1)} - \frac{\cos \theta}{L_f - (L_f - \lambda_f) \cos^2 \theta} \left\{ \sqrt{L_f \lambda_f} + (L_f - \sqrt{L_f \lambda_f}) e^{-a_f(\theta - \theta_1)} - (L_f - \lambda_f) \cos \theta \cos \theta_1 e^{-a_a(\theta - \theta_1)} \right\} \right] \quad (12)$$

$$i_f = \left[\frac{I_f}{L_f - (L_f - \lambda_f) \cos^2 \theta_1} \right] \left[\text{Same expression as in parentheses for } i_a \right] \quad (13)$$

Nitrogen Fixation and Conservation of Fuel

A. I. E. E., in Annual Convention at Atlantic City, Also Considers Transmission and Distribution Problems and Protection of Apparatus—Timeliness Is a Characteristic of the Proceedings

TWO subjects which have been made prominent on account of the war—nitrogen fixation and conservation of fuel by utilization of water power—were discussed at the Atlantic City convention of the A. I. E. E. this week. Other subjects that are especially timely in that they bear on the provision of reliable service, the protection of circuits and apparatus and the possibility of getting along without attendants were also considered. All except five of the papers presented are abstracted in this section. Information on the subjects not considered in this issue—aerial cable construction, pre-charged condensers, sustained short-circuit phenomena and automatic operation of hydroelectric plants—has been given in previous issues of the ELECTRICAL WORLD.

AMERICA'S POTENTIAL SUPPLY OF ELECTRICITY

Proposal to Generate Electrical Energy at Source of Supply and to Collect as Well as to Distribute It Electrically

In a timely paper presented at the Atlantic City convention of the A. I. E. E. Dr. Charles P. Steinmetz pointed out the national failure to develop the many small hydraulic power sites and also the extravagant use of fuel for heating purposes. He suggested that the solution of the problem of the economical development of more water powers and waste-steam plants lies in the adoption of the induction generator.

Dr. Steinmetz estimates that the coal requirement is now increasing at the rate of 56,000,000 tons per year and that the demand for 1918 will reach 867,000,000 tons, which represents about 867,000,000 kilowatt-years of energy. Of this total he estimates that 217,000,000 kilowatt-years is actually used. The total hydraulic energy available per year, computed from a study of rainfall between 30 deg. and 50 deg. latitude, is represented by about 380,000,000 kilowatt-years. At 60 per cent efficiency the total potential hydraulic energy usable would be 230,000,000 kilowatt-years, or just about sufficient to supply the national energy requirement for 1918. However, hydraulic energy can never replace coal entirely as a source of energy. This is a strong argument for efficient methods of using coal. A source of energy which is practically unlimited, if it could only be used, is solar radiation. This is probably the great source of energy of the future, about 130,000,000,000 kw. of power in the form of solar heat being available between 30 deg. and 50 deg. latitude.

SIMPLIFICATION OF HYDROELECTRIC PLANTS

The modern hydroelectric plant has become very complicated on account of the many auxiliary devices required for the electrical equipment and is not usually economical for capacities less than 1000 hp. But it is well known that the greater part of the national water-power supply is confined to comparatively small areas

at high altitude. In order to utilize these power sites, therefore, it is necessary to devise a simplified hydroelectric plant for capacities below 1000 hp. Some different and very much simpler type of generating station must be evolved before attempting to develop economically these thousands of small hydraulic powers, to collect the power of the mountain streams and creeks.

The hydroelectric station may be greatly simplified by the elimination of the low-tension busbars, making a permanent connection between the generator and transformer. The hydraulic governor may also be omitted from the turbine, permitting the generator unit to run continuously at full load. Finally, the induction generator should be substituted for the synchronous generator now commonly employed. The station thus becomes a comparatively simple one. But it must not be forgotten that the simplicity of the induction-generator

ATTENDANTLESS INDUCTION-GENERATOR PLANT AT NACHES, WASH.

By connecting a number of plants like this together power can be developed from small streams at relatively low cost

station results from the relegation of all the functions of excitation, regulation and control to the main synchronous station of the system. The induction-generator stations thus are feasible only as adjuncts to at least one large synchronous station.

Induction-generator plants may ultimately be made automatic in operation, requiring only occasional attendance and inspection. It should be possible to collect electrical energy from these plants just as energy is now distributed electrically and thus to utilize the great number of water-power sites now unavailable.

Regarding the operation of such an induction-generator set it may be started as an induction motor, and upon admitting water to the wheel the machine speed rises to full-load value. If the set is running at normal full load and the circuit breaker opens, the speed of the set may rise to a value somewhat less than 200 per cent of normal, but, on closing the switch, the speed imme-

diately falls to a point fixed by the power of the water-wheel slightly above synchronous speed for the induction generator. On the other hand, should the flow of water cease the induction machine slows down to a value slightly below synchronous and continues to revolve as an induction motor. Thus the induction generator lends itself very readily to automatic operation.

With induction-generator operation it is possible that a condition of instability may be encountered. If the generating unit has reached high speed, owing to opening of the circuit breakers, the speed may not fall to the normal full-load value if the turbine torque curve crosses the generator torque line in more than one place. It is very improbable that such a condition would arise in practice, but it should not be overlooked.

Of the hundred million tons of coal burned annually for heating purposes, most is used as steam heat. Dr. Steinmetz proposes to have the multitude of small heating plants develop steam pressures sufficiently high for the insertion of a turbine induction-generator unit in the steam system and thus to generate electrical energy as a by-product. The power would not be generated continuously, but mainly in winter and during the evening. Thus the maximum power generation by such fuel power plants essentially coincides with the lighting peak of the central station. These steam-turbine plants should be made simple and automatic. They might then be connected to the extensive energy collecting lines as in the case of the simplified hydroelectric plants.

ELECTRIC POWER FOR NITROGEN FIXATION

Relative Merits of Direct and Indirect Methods—
Combined By-product Coke Ovens, Generating
Plant and Nitrate Plant Suggested

In so large a field as that of the nitrogen fixation industry there must necessarily arise numerous improvements in the various processes which make it impossible for any one to forecast their future relative economic values. In the opinion of E. Kilburn Scott, who presented a paper before the A. I. E. E., the merits of the arc process of making nitric acid have not been adequately and sympathetically considered. To show its relative merits he points out that the indirect method involves the manufacture of carbide of calcium and its combination with nitrogen to form calcium cyanamide, from which ammonia, and in turn nitric acid, are obtained. The direct method, however, merely consists of combining nitrogen and oxygen from the air by means of the electric arc. In the direct method electric energy is the only factor, whereas by the indirect method a plant of very diverse and complicated character is required.

As a basic load for a power house the direct arc process presents the advantage that it can be established anywhere, because, the raw materials being only air and water, considerations of transportation do not enter into the situation.

It is particularly suitable for off-peak or off-season loads, for there is no fused material to solidify, and little to deteriorate in case of stoppage. Some of the furnaces can be switched on and off like an arc lamp, without detriment to brickwork or structural details or to the process of manufacture.

Because the plants in Norway are very large and only use hydroelectric power, a belief has grown up, that the arc flame process can only be worked commercially on a very large scale and with water power. As a matter of fact hydroelectric power may be a disadvantage because of its distance from industrial centers, for either the factory has to be placed in an out-of-way position, or else the power has to be transmitted over a long transmission line. The suggestion is made that the plants for making nitrates by the direct arc process should be erected at existing power houses to improve the load factor and reduce costs. By making nitrate in a number of centers its transportation to the explosive factories would be reduced, and the risk of interruption of supplies in case of accident or sabotage would be less than having a few very large factories.

An industrial process capable of furnishing electrical energy as well as a supply of ammonia would be ideal, and it so happens that this is the case with a regenerative coke-oven plant. Half the total gas made is available, and this can be easily turned into electrical energy.

OXIDE-FILM ARRESTER REQUIRES NO ATTENDANCE

Contains Neither Liquid Nor Inflammable Material
and Requires No Recharging—Has Been Tested
in Actual Service

The development of the aluminum-cell arrester represented a distinct improvement over the older multi-gap arrester, but it requires periodic recharging and contains an electrolyte subject to freezing, thus de-

FIG. 1—VOLT-AMPERE CHARACTERISTICS

The oxide film has very small leakage current compared to the aluminum-cell arrester.

manding constant attention. These objections, however, are eliminated in the new oxide-film arrester, which was described at the annual meeting of the A. I. E. E. by Crosby Field and Dr. Charles P. Steinmetz.

The action of the oxide-film arrester depends upon the fact that certain dry chemical compounds can be changed with extreme rapidity from very good conductors of electricity to almost perfect non-conductors by raising the temperature. Lead peroxide may be well utilized because it has a specific resistance of the order of about one ohm per inch cube, depending upon the pressure to which it has been compressed. There

are several other compounds and mixtures of compounds that give the same results as lead peroxide. If these powders are placed between two electrodes and a current passed, the temperature due to the resistance at the contact of the peroxide and the metal will cause the generation of heat locally at the surface. When this heat is sufficient to create a temperature of about

slight impedance to the flow of energy at abnormal voltages.

In all the commercial oxide-film arresters used for alternating current the power factor is nearly unity. For special purposes, however, the power factor can be made anything desired from 10 per cent to unity. This is obtained by combining with the conducting oxide other non-conducting materials.

OPERATION AND TESTS

The oxide-film arrester acts as a counter emf. equal to the normal circuit voltage, freely discharging any over voltage, but holds back the normal machine voltage. Thus the discharge is limited to the energy of the over voltage as in the aluminum arrester, and, like the latter, the oxide-film arrester can continuously discharge recurrent surges, such as arcing grounds, without endangering itself, for a considerable time.

On account of the many disturbances in large electric systems which cannot be completely reproduced in laboratories, the effectiveness and permanence of a lightning arrester cannot be given except by experience in industrial systems. Therefore, after extensive laboratory tests had been satisfactorily completed, the oxide-film arrester was installed in a number of places and has been in successful operation for over three years. It has proved its protective value and its permanence.

Of the tests made on the performance of the arrester it may be sufficient here to give only one, showing the action on a recurrent oscillation. The oscillogram, Fig. 2, was made in the usual manner, a surge or continual oscillation being produced by a large condenser connected to an alternating-current supply and discharging over a spark gap through an inductance. The latter

FIG. 2—TRANSFORMER PROTECTED

Top curve—60-cycle timing wave; middle curve—current through arrester; bottom curve—voltage across the circuit, showing limiting action of oxide-film arrester.

150 deg. C. a film of the lower oxides of lead forms, producing a wall of insulation which stops the current.

This method of film formation over any large area is rather irregular, and the oxide cannot, therefore, be used in such a fashion in the commercial arrester. However, any insulating film may be put on the electrodes initially. Materials such as thin layers of glass, water glass, halowax, cloth, balsam, shellac, oil, paints, lead paints, varnishes and lacquers of all kinds may be used, the only difference being the variation with the voltage at which the puncture of the film of insulation occurs.

The commercial lightning arrester consists of two outside sheet metal electrodes, set about 0.5 in. (12.7 mm.) apart, one or both covered with a thin insulating film and the space between the plates filled with some such substances as lead peroxide. The insulating film prevents any appreciable current flowing at a pressure of 300 volts per cell, but as the pressure rises slightly above normal the film is punctured in one or more microscopic points and the lightning discharge meets with practically no resistance and flows to earth. The dynamic current starts to follow, but because of the fact that the insulation was punctured in such fine points the current density near these points is exceedingly great. This results in a localized heating which speedily raises the temperature to a value sufficient to change all the conducting peroxide to insulating litharge. The film consequently reseals, stopping the further flow of dynamic current.

The film can be made of litharge itself or any of the insulating materials named. Several different kinds of electrodes may be used. The insulating film is best formed by dipping in varnish or lacquer highly burnished surfaces of brass, steel or copper. As the ohmic resistance of the arrester during discharge is low, when the insulating film is punctured the arrester offers very

FIG. 3—OXIDE-FILM ARRESTERS EQUIPPED WITH RAIN SHEDS

was chosen so as to give a frequency of 1200 cycles to the oscillation and thereby bring it well within the range of the oscillograph. This surge was impressed upon the apparatus to be protected, a transformer energized by another alternating-current circuit. Fig. 2 indicates conditions with an oxide film shunting the transformer and thereby protecting it. The oscillation

peaks are sharply cut off at a maximum voltage of 60 per cent above the circuit voltage, the value for which the spark was set.

The need of using a spark gap in series with the arrester is the only remaining undesirable feature which the oxide-film arrester shares with the aluminum-cell arrester, the multigap arrester and other types. Against high-frequency disturbances of moderate voltage, however, the only existing protection is the addition to the arrester of a capacity discharge path permanently connected from the circuit to ground. Such capacity path should be without resistance to flatten steep wave fronts and contain a moderate series resistance to dissipate high-frequency energy and stop cumulative oscillations in their beginning. An arrester that would give universal protection should be of the oxide-film or the aluminum-cell type with no spark gap but permanently shunted across the circuit and thus capable of taking care not only of the overvoltages but equally well of steep wave fronts and high-frequency oscillations, even if of lower than the circuit voltage.

IMPULSE PROTECTIVE GAP AN EFFECTIVE APPLIANCE

New Type of "Safety Valve" That Has Auxiliary Electrode Between Horns—Tests Made Give Interesting Results

In order to secure adequate protection against line disturbances of steep wave front it is important that a protective gap having the lowest possible impulse ratio be used. A new type of gap which possesses this selective property to a marked degree was described in an A. I. E. E. paper by Chester T. Allcutt. The device is called an "impulse protective gap" because of its particular effectiveness in discharging line disturbances of steep wave front.

In its most elementary form it consists of two gaps in series, each gap being shunted by a relatively high impedance. At line frequency these impedances are proportional to the respective discharge voltages of the gaps which they shunt, but they are designed to change at different rates with changes of frequency. Thus, under the action of a high-frequency impulse, one of the impedances becomes much greater than the other and causes most of the high-frequency voltage to be impressed on one of the gaps. The breakdown of this gap will result in the total voltage being impressed on the remaining gap, which will break down in turn. Commercially, however, it has been found more desirable to have only one gap with an intermediate electrode. A pointed auxiliary electrode gives better results than a spherical or cylindrical one.

Tests on this lightning arrester indicate that the presence of an auxiliary electrode does not appreciably lower the 60-cycle discharge voltage. With the auxiliary electrode in place breaks were somewhat less consistent than with the plain gap, but the irregularities are not of sufficient magnitude to indicate an appreciable lowering of the breakdown voltage. Preliminary tests with impulse voltages to determine the best values for the capacitances and resistances used in the circuits connecting the auxiliary electrode with each horn showed that these two values could be varied through wide limits without affecting the impulse discharge voltage.

In every test made the impulse discharge voltage was less than the 60-cycle breakdown value. With the form of gap having plain horn electrodes the impulse ratio increases rapidly with the larger gap settings, and it will probably become higher than unity for settings in excess of 3 in. (7.6 cm.) When spherical electrodes are used the impulse ratio will remain well under unity even for settings greater than 3 in.

A very great change in the shape of the main electrodes does not affect the impulse discharge voltage to a corresponding degree. However, the shape of the main electrodes will very materially modify the 60-cycle discharge. In view of these facts it is obvious that the lowest impulse ratio will be obtained by so shaping the

AUXILIARY ELECTRODE BETWEEN HORNS IS CONNECTED TO SERIES CIRCUIT OF TWO CONDENSERS AND AN IMPEDANCE BRIDGING GAP

main electrodes as to give the highest possible 60-cycle breakdown voltage. This condition is approximated with spherical electrodes.

Exhaustive tests of the gap have shown it to be superior to the ordinary sphere gap under all conditions. Even under the most unfavorable conditions the new gap gives a high degree of protection.

BALANCED PROTECTION OF CABLE SYSTEMS

Specifications for Split-Conductor Cable—Instantaneous Relays with End Impedances Recommended

Some years ago the Boston Edison company engineers became convinced that line protection devices which function with respect to time, to value of current or to direction of power flow were, in an extensive and rapidly growing transmission network, exceedingly difficult, and frequently impossible, to adjust and maintain in such a relation one to another as to provide for the selective disconnection of any faulty element, without simultaneously permitting the disconnection or shutdown of elements not themselves involved in

the fault. As a result, said W. H. Cole in a paper before the A. I. E. E., it was decided to make use of one or more methods based on the current-balance principle. At first serious consideration was given to the input-output method but this was later abandoned in favor of the balanced-pair method using paired conductors, now quite generally known as "split-conductor" cable. This was done because the balanced-pair method appeared to be less expensive especially when considering duct cost.

SPLIT-CONDUCTOR CABLE SPECIFICATIONS

At the beginning the company was forced to choose between a secondary dielectric of sufficient thickness to withstand successfully at least the star voltage of the system impressed across a dielectric being rapidly weakened by the arc at a fault and a dielectric of minimum safe thickness from a mechanical standpoint but of more than ample value for the normal operating voltage between conductor members. Since the major portion of the secondary dielectric is substantially an idle investment under all normal conditions, it was concluded that any reduction in its thickness with consequent cheapening of the cable is justified, provided a form of protective gear can be devised whereby a failure of the secondary dielectric under any circumstance would not prevent prompt disconnection of the line so affected.

The required form of gear subsequently became available, resulting in the company's standardizing, tentatively at least, a secondary dielectric thickness of 3/64-in. (1.19-mm.) paper for all-around-type, paper-insulated, concentric split conductors for 15,000 volts working pressure; 1/16-in. (1.58-mm.) paper for the same class of conductors for 25,000 volts working pressure, and 5/64-in. (3.96-mm.) paper for both 15,000 volts and 25,000 volts, sector-type, paper-insulated, concentric split conductors. The additional thickness in the sector split type is provided for mechanical reasons.

Owing to the war acceptance of cable not quite up to the pre-war standard has been forced upon users; so more attention has been required in transposing conductors than would usually be necessary in order to secure the desired balance in the completed lines. The Boston company aims to secure impedance balance in completed lines to within one-tenth of 1 per cent. With uniformly well-balanced cable sections this result is ordinarily secured with from one to five transpositions. Its present practice is to use no less than three, dividing the line into four sections.

RELAYS FOR CURRENT-BALANCE PROTECTION

Relays should be instantaneous-overload type, operative on small amounts of energy, hand resetting, and the moving parts should have small inertia. Secondary devices are necessary to close the contacts in the tripping circuit. An auxiliary break in the tripping circuit should be provided to be actuated by the movement of the main switch mechanism. The simple differential transformer is undoubtedly the best device for comparing the currents in the paired conductors.

Since it is absolutely necessary that the scope of the protection shall include the entire line and extremely desirable that line disconnection be effected while the fault current is moderate in value, it is necessary to provide for end-fault protection. This is secured by

the use of so-called end-impedance devices, which include the reactive type and the non-reactive type. The three point per pole or split-contact switch is the best known form of non-reactive type. As the relays must not operate on normal differential currents, it is necessary, in order to produce disconnection of the distant end, that the impedance of one of the current paths be altered with respect to the other to the extent necessary to produce a tripping differential current in the balancing transformer at the distant end of the line.

RELATIVE MERITS OF REACTIVE AND NON-REACTIVE TYPES

The choice of end-impedance devices should be governed by the strength of design, space required for their installation, effect on regulation, effect on switch gear and switchboard design, rapidity of action, cost, etc. From the standpoint of strength of design, the balance appears to be in favor of the reactive type, since it has no moving or wearing parts requiring adjustment or renewal. The space requirement usually is a local consideration. The reactive type in some forms has some effect upon voltage regulation. In any form the effect is not serious, particularly when the growing use of current-limiting reactors is considered.

It is obvious that standard types of switches are adequate with reactive schemes of end protection, but the non-reactive type, as embodied in the split-contact switch, requires a special design of switch. For small capacities this may not be a serious matter, but for larger system capacities the necessity of designing the three-point or split-contact switches so that all three breaks per pole have the same breaking capacity means at least 50 per cent more space per pole on account of the additional pot.

On the whole, it appears, considering the rapidity of action, at least on large systems, that the reactive form of end-impedance device has a distinct advantage over the non-reactive type.

ORDINARY PAIRED CABLE

If the ordinary type of overload relay is used with independent paired conductors, their settings might need to be so high as to preclude operation on section faults, or in any event to prevent the obtaining of the maximum benefit of balanced protection.

In order to obviate the necessity of the high relay settings and at the same time to insure non-operation on through short-circuits, relays have been developed both in this country and abroad, variously called "biased relays," "percentage balance relays" and "ratio balance relays."

In order to choose correctly the proper winding ratio for ratio balance relays, it is necessary to know what the normal differential current will be under extreme conditions and the percentage it bears to the simultaneous vector sum of the compared currents. Once adjusted for this normal relation, they cannot operate on any value of through current, since the restraining force will then always be in excess of the operating force.

In conclusion, Mr. Cole said: "A sufficient number and variety of actual faults have occurred to demonstrate that full reliance may be placed on the system of protection, provided that the fundamental requirements are met in its design, installation and operation."

DESIGNING INSULATORS FOR BEST FLUX DISTRIBUTION

Electrostatic Field Around Insulators Studied to Give Basis for Constructing More Effective Insulators

The design of an insulator should depend not only upon the practical experience and opinions of operating engineers, but also upon purely theoretical considerations, chiefly distribution of the electric field at abnormal voltages, said G. I. Gilchrest, in a paper read at the recent annual convention of the A. I. E. E. With this in view the author has analyzed the various causes

DIELECTRIC FIELD AROUND THREE INSULATORS OF RECENT DESIGN

of insulator failure and determined by experimental means the shape that insulators should have to be most effective for given conditions.

CAUSES OF INSULATOR FAILURE

Among the principal causes of pin-type insulator failure he cites the following: Improper distribution of dielectric field and surface leakage; porosity; mechanical breakage, lightning, birds and animals short-circuiting line; unequal expansion of metal, cement and porcelain; internal stresses in materials and defective batches.

To visualize the electric field around insulators Mr. Gilchrest supported the insulators so that the plane of the field to be studied was horizontal. Then a piece of fullerboard was fitted over a half section of the insulator in this plane and asbestos particles were sifted thereon. The particles arranged themselves along the electrostatic flux lines.

From studies of this kind he developed several new shapes of insulators, for which the following advantages are claimed:

1. When the insulator is dry the corona and static formations are practically limited to the tie wire and line wire up to flashover voltage.
2. When the insulator is wet no corona or static formation occurs up to flashover voltage. The flashover voltages for given over-all dimensions are thereby increased.
3. The leakage resistance per shell is increased gradually from the head to the center shell. This takes into account the probability of the lower sheds becoming dirtier than the tops. The voltage distribution per shell is, therefore, equal when the insulator becomes dirty and wet and a heavy leakage current passes over the insulator.
4. Since the capacity per shell is about constant, the voltage distribution per shell will be uniform when the insulator is clean and in dry air.
5. Since the distribution of voltage per shell depends upon the capacity current and leakage current, the distribution

of voltage per shell in these designs should be approximately uniform under all operating conditions.

6. The resistance of the insulator to side pull for a given weight and given electrical strength is relatively high. This is due to the feature of the design whereby the flow lines of the electrostatic field and the mechanical stress lines coincide.

7. The design of the individual shells is such that when they are tested before assembly the surface conforms to the electrostatic flow lines. This allows the testing of the individual parts to a higher percentage of service voltage than was possible in case of the individual shells of the older designs.

8. Owing to the shape of individual parts and of the assembled unit, the insulator sheds when hit by stones, rifle balls, etc., break only to a limited extent. The unit, there-

fore, offers a considerable percentage of its original resistance to flashover after the sheds are broken. The same feature tends to protect the insulator from complete failure during the flashover in service.

9. Each characteristic of the insulator which would vitally affect durability in service has been treated uniformly throughout the line.

PREVENTING FLASHOVER AT COMMUTATOR AND BRUSHES

Use of Screen Barriers Between Brushes and Provision of High-Speed Circuit Breakers Effective with Direct-Current Machines

Any means for preventing flashing at the commutator and brushes of direct-current machines must operate very quickly if it is to be effective, said J. J. Linebaugh and J. L. Burnham in their paper before the A. I. E. E. convention. This requirement is met to a great extent by using high-speed circuit breakers or barriers between brushes, but complete protection requires both. The cause of flashover may be reduced by providing magnetic fields of proper strength and distribution to influence the coils during commutation.

With special high-speed circuit-opening devices operating in about 0.005 second, the more sensitive machines, such as 60-cycle synchronous converters, may be short-circuited without flashing over, even though the maximum current is of higher value than would cause flashing with suddenly applied load and ordinary circuit-breaker protection. The speed at which a current breaker must operate to prevent flashing depends on the amount of load through the machine, but tests indicate that, under the worst conditions, it must be quicker than one half cycle of the machine to be protected.

One type of circuit breaker which has been found specially suitable is being used on the Chicago, Milwaukee & St. Paul Railway. It has a laminated contactor which is held closed by an electric holding coil. When the load becomes excessive the current through a series bucking coil offsets the magnetic flux of the holding coil, allowing a spring to separate the contacts.

Automatic substations at Des Moines, Iowa; Columbus, Ohio, and Montieth Junction, Mich., are using barriers which have been found very effective in preventing flashover between brushes. A close-fitting box of fireproof insulating material surrounds each set of brushes and is placed so as to give a small clearance between the box and the commutator. On the side of the box toward which the commutator rotates after leaving the brush a V-shaped "scoop" of fireproof in-

SCREENS AND SCOOPS AT LEFT COOL AND DIVERT ARCS PRODUCED BY FLASHING BRUSHES

insulating material is fastened, preferably having good heat conductivity, pointing toward the brush and having small running clearance from the commutator.

Radially above the scoop, about 1 in. (2.54 cm.) apart, are two metal screens, one coarse and one fine mesh, through which the arc is successively forced and cooled.

TRANSPOSITION OF PARALLEL POWER AND TELEPHONE LINES

"Exposed Line" System Most Important Remedy for Inductive Effect—Limitations of Two Methods Devised

"Of all the means used to reduce the inductive effect between power and telephone circuits the co-ordinate transposition of both classes of circuits is probably the most important," said Harold S. Osborne in a paper before the A. I. E. E. His method has been carefully investigated in California by the joint committee on inductive interference, with the result that a method known as the "exposed-line transposition system" has been developed. Two designs have been completed, called the E and L sections. The first is for a maximum length of 12.8 km. (7.9 miles), the other is best for less than 6.4 km. (3.9 miles).

The E section can be used to co-ordinate with trans-

positions in three-phase power circuits which create for the maximum length of E section 0.8 km. ($\frac{1}{2}$ mile), 4.8 km. (3 miles) or 9.6 km. (6 miles) in the power circuit. It was found possible to design the L section so that it balances a three-phase power line transposed at the quarter-section points.

The exposed line transposition system has been designed primarily for use on toll lines and not for use on joint lines with power distribution circuits.

When large inductive effects are experienced from circuits less than 20 ft. (6 m.) away from a side circuit, the variation in separation between the telephone circuit and the exposing circuits as the side circuit shifts from one pair of pin positions to another must be taken into consideration. The E section is not designed to give a high degree of balance under this condition for all circuits in each eighth section, but does give balance to uniform outside induction effects for most circuits in each eighth section and, with one exception, for all circuits in each half section. Under similar conditions the L section gives a balance for most circuits in each quarter section and for all circuits in each half section.

It should be clearly understood in the use of the telephone transposition sections that it is important to co-ordinate the transpositions in the telephone lines both as regards relative length and as regards relative location of telephone transposition section and transpositions in the power circuits.

REACTANCE OF ALTERNATORS AND ITS APPLICATIONS

Simple Method of Predetermining Reactance Which Is Applicable to Wide Range of Synchronous Machines

The calculation of initial short-circuit currents of synchronous machines may be satisfactorily worked out from design data provided that the constants of the machine can be predicted with reasonable accuracy. A method of predetermining armature reactance applicable to a wide range of synchronous machines has been worked out by R. E. Doherty and O. E. Shirley and was fully explained in a paper presented at the annual convention of the A. I. E. E. The complete scope of the paper may be summarized as follows:

1. To present a reliable, general method of obtaining armature reactance of synchronous machines.
2. To give a simplified general equation, in accordance with standard construction, which will enable the designer to calculate armature reactance quickly by the use of curves and design data sheets.
3. To derive a formula for the calculation of field inductance which is used in the calculation of initial short-circuit currents and to explain the physical phenomena occurring at short circuit.
4. To derive an expression for accurate calculation of armature reaction, taking into account the effect of field distribution.
5. To show the effect of harmonics in the no-load field-flux wave on the field excitation under load.
6. To give a simplified method of calculating field excitation, using armature reactance value previously determined.

"The Engineer Is the Hope of the Nation"

E. W. Rice, Jr., Retiring President of the American Institute of Electrical Engineers, Addressing the Atlantic City Convention, Makes Clear the Part of Engineering in the War

THE vital importance of revising or further extending the activities of the A. I. E. E. so as to help in a speedy winning of the war, and the necessity of looking ahead to the solution of engineering problems which will be involved in the reconstruction work after the war, were important subjects dwelt on at the annual convention of the A. I. E. E. held at Atlantic City on Wednesday, Thursday and Friday of this week.

ADDRESS OF PRESIDENT E. W. RICE, JR.

Mr. Rice, in outlining the value of the Institute, said:

"The engineer is the hope of the nation, not only now, when we are at war, but even more so in the future in the days of reconstruction following the great peace. The engineer may perform valuable service when working alone, but his usefulness and power is manifestly greatly increased when acting in co-operation with thousands of his brothers.

"The Institute is not only a democracy, but is a democracy of educated men, and such men have a heavy responsibility to society at present and in the future. They should be leaders and exemplars for those who have not been so fortunate as to have enjoyed their opportunities. The Institute needs its members and the members need the Institute, that the electrical engineer may fulfill his high destiny."

There has been no material improvement for several years in electrical units such as dynamos, motors, transformers, etc., said Mr. Rice. In the field of thermodynamic engines, represented largely by the steam turbo-generator unit, some improvement has been obtained. While not large, this is doubly important because of the great increase in the cost of fuel. He added:

"Concurrently with this improvement in the turbo-electric machines, great advances have been made in the design and operation of the steam-producing devices—the boilers, auxiliaries and other features of the modern power station. As a result the thermal efficiency has been rapidly improved. The steam turbo-electric unit has not reached its limit of thermal efficiency."

Progress has been made and is still possible in the generation, transmission and utilization of electrical energy.

"Improvement has been effected," said Mr. Rice, "not only by changes in designs of the units themselves, but also by their method of use, based upon the recognition of the fact that the elimination or reduction of the losses at light load will greatly improve the total efficiency, especially when the time of use of the apparatus under load is a small part of the total time.

"It has been estimated, and it seems a conservative estimate, that through the saving in reserve equipment, improvement in load factor and the diversity of different loads, the useful output of groups of large systems may through interconnection be increased about 25 per cent."

The standardization committee has been of inestimable value to the profession and to the industry, Mr. Rice said. "As a result of its work the cost of electrical apparatus to the consumer has been greatly reduced over a number of years and the quality has not been sacrificed but has been improved."

President Rice then referred to the growth of 60-cycle systems, which it is now estimated represent about 70 per cent of the total power supplied in the country. This standardization will hasten the time when a network of the transmission lines, fed by super-power stations, will cover the country.

Reference was made by Mr. Rice to the marked advance in electric furnaces. It is estimated that the number of these in the United States has increased about 40 per cent in the last year and that there are now in operation over five times those of five years ago.

On the work of the electrical engineer in the war Mr. Rice said:

Electrical engineers have been devoting much time to the solution of many war problems. It is not desirable or possible to review such work at present, but when the veil is lifted we shall all be gratified with the result. We must content ourselves with the mere statement that this work has covered means for the detection of the pirate submarine, wireless signaling and telephoning for army and navy and aircraft devices, searchlights of novel design and great power, improved methods in manufacture of ammunition and ordnance, electrochemical work of every description, electric welding, X-ray sets of greater simplicity and accuracy, and many other lines too numerous even to mention. . . . I hope that the time will come when the story may be told, so that the world may realize the debt which it owes to scientific men and engineers, without whose arduous, unselfish and almost inspired work our cause, righteous as it is, would have no chance of a victorious conclusion.

Mr. Rice reverted to his remarks at the midwinter convention on the importance of railroad electrification. In concluding he outlined the essential place of electric power in the war program. The power to operate the war industries, in view of its great economy and flexibility, must be electrical. He continued:

While this country was fortunate in having available a magnificent system of power stations, so great was the magnitude of the demand for increased power created by the war industries that it is estimated there will be a shortage of at least 500,000 kw. of electric power in the Eastern district.

It is vitally important that the great electrical power-producing companies of this country should be helped in every way to meet the heavy demand which is placed upon them, as it has been demonstrated that the quickest, most efficient and altogether best way to meet the demand for power is through the expansion of such existing organizations and installations.

In presenting the president-elect Mr. Rice referred to the fortunate combination of thorough acquaintance with theory and equal familiarity with practice which Professor Adams possesses. Mr. Rice added that his confidence in the future achievements of the Institute was increased by Professor Adams' election to the presidency.

REMARKS OF PRESIDENT-ELECT COMFORT A. ADAMS

Professor Adams, in responding, said that these are not normal times and that Institute proceedings cannot be conducted in the usual way. While he hesitated about suggesting any definite directions along which the Institute activities should be carried, he expressed the opinion that the chief thing to consider now is how the Institute can help in a speedy winning of the war, or, looking ahead, the Institute might consider how to cope with the engineering problems which will be imposed during the reconstruction period after the war. Owing to the rapid revolutionary changes in economic conditions and international relations which the war is forcing, engineers will be more interdependent than ever before in facing new problems. As a result there will be need of co-operative effort among the broadest-gaged engineers of the widest vision. In closing, Professor Adams expressed great optimism regarding the future.

REPORTS OF COMMITTEES

N. W. Storer, chairman of the traction and transportation committee, called attention to the fact that many trunk lines have practically collapsed under war conditions but that electrified lines have not suffered so greatly. Street railways have likewise been hard hit.

Prof. Alexander Gray, chairman of the committee on electrical machinery, suggested that it might be advisable for the committee to serve as a clearing house for suggested changes in standardization rules.

Edward P. Hyde, chairman of the lighting and illumination committee, gave a brief summary of progress in electric illumination, referring particularly to protective lighting and motion-picture projection.

L. E. Imlay, chairman of the committee on transmission and distribution, cited instances of past work and recommended further investigation of insulator problems and electric loss in cables.

Francis A. J. Fitzgerald, chairman of the electrochemistry and electrometallurgy committee, suggested co-operation with the American Electrochemical Society and intense study of hydroelectric development.

A. G. Pierce, chairman of the industrial and domestic power committee, called attention to the tabulation of technical data regarding industrial applications which it has been making and suggested that the committee be broadened or that a new committee be formed to handle the work. This is now of enormous proportions.

Prof. Frederick Bedell, chairman of the committee on electrophysics, urged that steps be taken to maintain adequate teaching staffs to insure continuous output of technically trained men.

D. W. Roper, chairman of the protective devices committee, recommended that an investigation of lightning arresters and protective devices for tie lines be pushed to a conclusion and that relay nomenclature and ratings of circuit breakers be standardized.

K. A. Pauly, chairman of the committee on application of electricity to mines, urged co-operation with the American Institute of Mining Engineers.

S. G. Rhodes, chairman of the instruments and measurements committee, stated that no new development work along purely commercial lines is being undertaken by manufacturers.

Prof. Ernest J. Berg, chairman of the educational

committee, presented a synopsis of electrical engineering courses in various colleges and suggested how some colleges might better them.

H. A. Hornor, chairman of the marine committee, called attention to the proposed use of oil-engine-driven generators and motors for ship propulsion and urged closer co-ordination of the work of the various committees.

The subject of education was discussed at length by Prof. W. I. Slichter, Dr. C. P. Steinmetz, Prof. V. Karapetoff, W. L. Upson, Prof. Samuel Sheldon and N. A. Carle. Among the principal points brought out were the possibility of developing personality, the psychology of successful education, the need of "punch" and natural ability to supplement education, the importance of inspirational power in instructors, the fact that colleges attempt to teach too many or unnecessary subjects, and the need of transferring credit from manufacturer to central station or vice versa for education secured in cadet courses.

WEDNESDAY AFTERNOON SESSION

On Wednesday afternoon the following papers were presented: "Split-Conductor Cables—Balanced Protection," by W. H. Cole; "Overhead Cables," by E. B. Meyer, and "The Applications of Theory and Practice of Transmission Systems," by G. I. Gilchrest. Abstracts of Messrs. Cole and Gilchrest's papers will be found on pages 1371 and 1372.

Among those who took part in the discussion of balanced protection were P. M. Lincoln, E. B. Meyer, J. R. Craighead and O. C. Traver. In these discussions it was said that split conductor cable can be made for 7 to 10 per cent more than ordinary cable when used more extensively, but that cost should not be a major consideration. The points cost 10 to 15 per cent more. Several agreed that the carrying capacity is not reduced by the construction. Mr. Traver said that one large operating company could release \$1,000,000 worth of cable by operating its system in parallel, a practice permitted with balanced protection.

Considering the use of aerial cable, several speakers called attention to the possibility of the sun's rays limiting the rating of aerial cable if the outer covering is dark. Unequal expansion of the cable and messenger wire might cause separation of the points, it was said, although Mr. Meyer maintained that no trouble had been experienced from this cause. The rating of other circuits in series also limits the carrying capacity of the cable. Among those who took part in the discussion were W. A. Delmar, J. B. Taylor, Philip Torchio and J. A. Johnson.

In the discussion of insulator problems Prof. C. F. Scott emphasized the necessity of studying the electrostatic field around insulators in developing efficient designs and suggested that higher voltage lines might be supported on pin insulators if the design suggested by Mr. Gilchrest gives the results expected. Prof. V. Karapetoff explained how electrostatic flux can be studied with molten paraffine and lycopodium seeds after allowing the paraffine to harden. L. W. Chubb pointed out that it is not necessary to consider refraction of electrostatic flux if insulators are properly designed. Mr. Gilchrest closed by saying that pin-type insulators of the type he mentioned in his paper are being considered for 110,000-volt lines.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

BRAZING PIPE JOINTS TO STOP STEAM LEAKS

This Method Found Especially Satisfactory for Small Connections Needed to Unite Measuring Instruments—Eliminates Inaccuracies

One of the jobs that require careful attention when steam-measuring instruments are being installed is that of connecting the joints in the small pipes leading from the steam mains to the instruments. Many companies which are now installing boiler-room instruments so as to obtain an accurate check on the efficient use of coal discover that unless their pipes are carefully installed they are liable to become leaky at the joints. The Iowa Railway & Light Company of Cedar Rapids, Ia., when it installed additional instruments in its steam plant brazed all of the joints in the small connecting pipes with the effect that no trouble has been encountered and that the instruments give correct readings.

DETERMINING LABOR COSTS OF POLE LINE EXTENSIONS

Advisability of Extending Line to Consumer Decided Upon by Method That Is Applicable Regardless of Prevailing Prices of Labor

BY A. G. DRURY

In order to find out if it will pay to supply a prospective consumer with electric energy it is always well to determine beforehand the cost of material and labor.

From a study of the time required to perform various line construction operations the author has concluded that the following units are conservative for checking estimates: Loading and unloading one pole, 2 man-hours; haulage per mile, 15 man-hours; digging and setting one 35-ft. (10.6 m.) wood pole, 4 man-hours; equipping one four-pin cross-arm with pins and insulator and attaching to pole, 2.5 man-hours; stringing and tying 100 ft. (30.4 m.) of conductor to insulators, 2 man-hours.

While the time required for the different items of construction may seem liberal, consideration must be given to the fact that some time is lost both at starting and afterward.

EFFECT OF MAGNETIC FIELD ON CIRCUIT-BREAKER ARC

Apparatus Designed to Reproduce Action of Opening Circuit Breaker and to Determine Density and Length of Arc in Varying Field

BY A. M. HOLCOMB*

To determine definitely the values of the density, length, etc., of the arc occurring when a circuit breaker is opened, some means must be worked out whereby the properties of the arc may be observed. The apparatus developed for this purpose, which is shown in Fig. 2, consists of two carbon contacts so linked that they can be steadily opened and closed by means of a belt-driven pulley. Two lenses and screens are placed so that the image of the "split" and length of the arc

FIGS. 1, 2 AND 3—APPARATUS FOR STUDYING EFFECT OF MAGNETIC FIELD ON CIRCUIT-BREAKER ARC, WITH RESULTS OF A TEST

The labor cost has risen to such an extent recently that the old methods of estimating this cost have grown obsolete. A rule that can be applied at any time is one that uses the man-hour as a basis of cost—that is, the number of men multiplied by the hours they work. This figure may be multiplied by the prevailing wage.

will be projected on screens. They can then be measured and the actual length calculated. Calibrated field poles were placed near the arc with their current controlled by a rheostat.

*Extract from thesis by Shetler and Gartia, Case School of Applied Science, Cleveland, Ohio.

Non-inductive loads were used in making the tests, the results of which are shown in Figs. 1 and 3. The former curve shows the effect of varying the field strength when the breaker is operating at a steady speed. The curves of Fig. 3 show the effect of opening the breaker at different speeds. The current was left on for only one or two contacts so that the contacts would not become red and the gap filled with conductive vapor.

By referring to Fig. 1 it may be seen that the arc length varies indirectly as the voltage, current and field strength, but no benefit is obtained by increasing the field strength beyond 12,000 lines per square inch. The gap chamber was comparatively open, and the noise of break at low densities sounded like a slight puff, whereas at high densities there was a slight bark. As nothing resembling an explosion occurred, there is no disadvantage in having a magnetic blow-out.

The results plotted in Fig. 3 illustrate the fact that no advantage is obtained by opening the breaker quickly. The tests do not show excessive or short-circuit conditions, but depict only the effects on the magnetic field when the breaking occurs on moderate overloads.

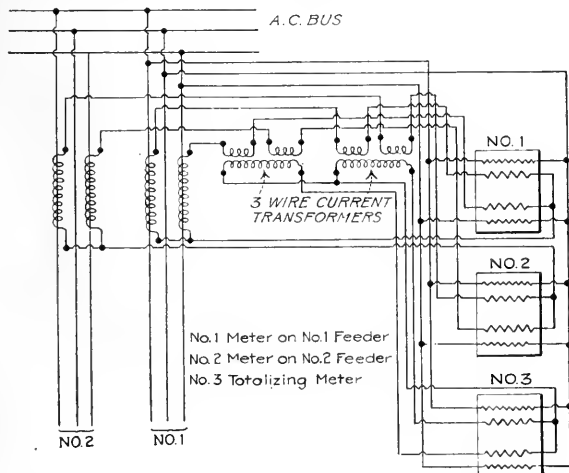

ADDING ENERGY CONSUMPTION OF TWO SEPARATE SERVICES

Three-Wire Transformer Interposed in Current-Coil Circuit of Individual Meters Used as Means of Measuring Energy Collectively

BY JOSEPH N. MCCLURG

Foreman Meter Department, Scranton (Pa.) Electric Company

The total energy of two or more services that cannot be tied together may be conveniently determined by the method shown in the accompanying illustration. This system can be used advantageously when the consumer wishes to know the cost of serving each of several plants whereas the company is interested only in the total energy consumed.

THREE-WIRE CURRENT TRANSFORMERS TOTALIZE CURRENT IN TWO SERVICES

The service meters for each plant are connected in the ordinary manner except that three-wire transformers are interposed in the current-coil circuits. The primaries of each leg of the transformers are connected in the same phase. The secondaries of both of these transformers are connected in multiple with the current coils of the totalizing meter, and therefore

the meter will record the total energy consumed by the two distribution systems. The potential coils are connected in the ordinary manner.

METHOD OF FLATTENING LEADS FOR ARMATURES

Inexpensive Tool Provides Efficient and Quick Means for Shaping Conductors to Enter Commutator Lugs

BY FRANK HUSKINSON

Flattening copper wire without producing the hardness or brittleness usually caused by hammering the leads can be accomplished by the machine shown in the accompanying illustration. The device consists simply

MACHINE HAS SMALLER NUMBER OF PARTS AND CAN BE EASILY MADE IN THE SHOP

of two knurled rolls mounted on an iron stand. The copper lead is inserted between the holes and the handle is turned, thus drawing the lead between them and flattening it. The machine is inexpensive to make and is portable, so that it may be placed near the armature.

SPONGE-FELT INSULATION FOR STEAM LINES PROVES VALUE

Formation of Icicles on Pipe in Winter Indicated that Its Exterior Was Not Heated Appreciably by Radiation

A 2200-ft. (670-m.) length of outdoor pipe line 6 in. (15 cm.) in diameter transmitting steam having a temperature of 466 deg. Fahr. has been successfully insulated from the low temperature during the winter months by a combination of sponge and hair felt. The sponge is placed next to the pipe and covered with the hair felt. The hair felt will not withstand high temperature but makes an excellent intermediate or superficial covering. The total thickness of the heat insulation on this line is 3 in. (7.6 cm.), and tests show that the outside temperature is only slightly above that of the air with the latter at 22 deg. Fahr. In the winter icicles formed on the line.

11,000	93,600	233,300	88.4	71.4
10,000	111,000	215,900	90.0	66.0
9,000	128,900	198,000	91.7	60.6
8,000	146,800	180,100	93.8	55.1
7,000	165,000	161,900	96.3	49.5
6,000	184,200	142,700	99.1	43.7
5,100	204,500	122,400	100.0	37.4

permissible rate necessitates purchase at a load factor higher than the natural load factor of the system. In other words, a certain amount of energy during peak-load hours must be generated by steam. An average

daily load curve is drawn in the usual way. Successive peaks are cut away (presumed to be transferred to the steam plant), and the load factor and quantity of energy in the remaining block are plotted against kilowatts in the manner indicated.

For instance, with the load curve shown, to purchase energy on an 80 per cent load factor basis all peaks above 15,700 kw. must be carried by the steam plant; 92.4 per cent of the energy will be purchased and the remaining 7.6 per cent steam-generated. The curves are computed in a simple manner as indicated in the tabulation. Areas of the peak, or series of peaks, above each 1000-kw. line are measured by means of a planimeter, or by counting squares on cross-section paper, and translated into kilowatts, as indicated in the second column. The area above the line is taken rather than that below, as the former is smaller and may be determined with less liability of error. It is ordinarily best to measure by 1000-kw. zones and to take the summation of the zones above each limit. The kilowatt-hours represented by the integration of the curve below each limit are then determined by subtraction from the total (column 3) and the load factor (column 4) by the usual formula.

This form of analysis is particularly necessary where a rate of the following general form is offered:

ASSUMED VARIATION OF RATE WITH LOAD FACTOR

Load Factor, per Cent	Rate per Kw.-hr.	Load Factor, per Cent	Rate per Kw.-hr.
60 to 64.9	\$0.008	80 to 84.9	\$0.006
65 to 69.9	0.0075	85 to 89.9	0.0057
70 to 74.9	0.007	90 or over	0.0055
75 to 79.9	0.0065		

Assume that peak-load energy can be generated by steam at \$0.01 per kilowatt-hour. We may pick off from the curve the percentages purchased and generated by steam for each rate and load factor offered, and from these readily determine the following average costs per kilowatt-hour:

VARIATION OF UNIT COST WITH LOAD FACTOR

Load Factor, per Cent	Average Cost per Kw.-hr.	Load Factor, per Cent	Average Cost per Kw.-hr.
60	\$0.00801	80	\$0.00631
65	0.00753	85	0.00651
70	0.00706	90	0.00703
75	0.00661		

From which it is evident that purchase on an 80 per cent load factor is most advantageous for the particular set of costs and shape of load curve that have been under review.

EFFECT OF APPLIANCE LOAD IN SPARSELY SETTLED DISTRICT

Appliance Load Rather than Lamp Load as Controlling Factor in Establishing Maximum Demand in Outlying Residential District

In some residential sections served by the St. Joseph (Mo.) Railway, Light, Heat & Power Company only a 2-kw. transformer is justified from calculations based on the number of sockets or number of lamps served. However, it has been noticed in such districts that on Mondays and Tuesdays the trouble department answers a large number of complaints caused by blown transformer fuses.

This is taken to indicate that the load produced by the labor-saving appliances, such as washing machines and electric flatirons, is considerably in excess of any peak lighting load that may come on a transformer. To eliminate the necessity of such frequent trouble calls over-fusing is sometimes resorted to. These conditions are met with in the sparsely settled parts of the outlying residential district of the city.

TRADE ACCEPTANCE HELPS CENTRAL-STATION BUSINESS

Under Plan Worked Out at Columbus Contractor and Manufacturer Finance 50 per Cent of Sales of House Wiring and Appliances

In the latter part of last year the Columbus (Ohio) Railway, Power & Light Company discontinued the sale of electrical appliances and the wiring of old houses on the partial-payment plan. The matter was considered for a month or six weeks, and at that time it was decided to continue as before, but finally the condition became such that the management issued an order to stop such sales, and this order was immediately put into effect.

As a real new-business department does not enjoy having its means of doing business eliminated, Mr. W. A. Wolls, new-business manager, said before the commercial men of the Ohio Electric Light Association, his department at once set about to find ways and means whereby it could again produce business for the company. Upon investigation it was found that the trade-acceptance plan of financing would meet the requirements. Inasmuch as the company enjoyed the best of co-operation with the electrical jobbers and contractors, a plan for the wiring of old houses was submitted to them whereby the company would give to the contractor a contract to wire a house and on completion of the work would present his bill to the company with a trade acceptance attached ready for the signature of an authorized officer of the company. This trade acceptance would be returned to the contractor. The trade acceptance is made payable in 120 days. The contractor discounts the trade acceptance with his bank at the rate of 6 per cent per annum, whereas formerly the company would discount all bills at 2 per cent for cash. The contractor's revenue for the work done is exactly the same as it was before the use of the trade acceptance. This plan has been in successful operation for the last two months.

In regard to the sale of electrical appliances on the partial-payment plan, the company, Mr. Wolls

stated, formerly sold appliances on the basis of 10 per cent down and the balance in ten equal monthly installments. The company has now arranged with the customer a new basis of approximately 25 per cent down and the balance in six equal monthly payments; and with the manufacturers of the larger appliances, such as washing and ironing machines and vacuum cleaners, a basis whereby they accept in payment trade acceptances payable one-third in 60 days, the balance in 90 and 120 days.

Under the foregoing arrangement the wiring of houses and the sale of appliances is done on the basis of 50 per cent, financed by the electrical contractor and the manufacturers of appliances and 50 per cent by the company. This plan, Mr. Wolls states, is a war-time necessity.

AVERAGE SMALL-MOTOR ENERGY CONSUMPTIONS

Majority of Groups Used Approximately 25 Kw.-Hr. per Connected Horsepower, or About 5 per Cent Use of Rating

A Western central station recently analyzed the energy consumptions of its smaller power customers in order to determine the incomes which might be expected from future extensions. The customers were grouped by connected load, and the consumptions for

ENERGY CONSUMPTIONS OF SMALL POWER CUSTOMERS

Nominal Hp.	Limits	Horsepower Months	Kw.-hr. Consumption	Kw.-hr. per Hp.-Month
1	1 — 1 1/2	843	25,803	31
2	1 3/4 — 2	1,220	25,704	21
3	2 1/2 — 3 1/2	1,120	22,677	20
5	4 — 6	8,753	230,683	26
7 1/2	6 1/2 — 8 1/2	1,684	87,328	52
10	9 — 12	2,512	140,376	56
15	12 1/2 — 17	2,725	65,840	24
20	17 1/2 — 22	2,196	64,614	29
25	22 1/2 — 27	3,622	198,034	55
30	27 1/2 — 32	1,934	52,006	27
35	32 1/2 — 42	6,133	173,651	28
50	42 1/2 — 62	6,218	246,015	40
75	62 1/2 — 88	1,107	225,880	35
100	88 1/2 — 112	5,013	166,970	33

each group were tabulated for a number of months. It is interesting to note that the majority of groups consumed approximately 25 kw.-hr. per horsepower, connected per month, or about 5 per cent use of rating. The remainder consumed close to 55 kw.-hr. per horsepower per month. The latter figures were probably caused by a few customers of high load factor.

of the World

Generators, Motors and Transformers

Limits to Alternator Voltage.—F. D. NEWBURY.—

For fifteen years the maximum voltage for which generators have been wound has remained practically the same. To-day 13,200 volts is the highest standard generator voltage used in this country. There are several reasons why generator voltages have not increased. The first is that as the voltage passes 20,000 volts (requiring a test voltage of approximately 40,000 volts) the weight and cost of the generator increase rapidly and soon become greater than the combined cost of an equivalent lower voltage generator and transformer. Another reason is that the elimination of the transformer subjects the generator to the direct shock of all the abnormal voltage waves originating in the transmission system. Experience has shown the necessity of heavily insulating the turns of the transformer nearest the terminals—in fact, the first few turns are insulated from each other as effectively as the coils are insulated from ground. This protection is impossible in the generator unless each coil has only a single turn, but this would result in a prohibitive number of slots for the voltages under consideration even with the largest units and the highest speeds. The danger from abnormal voltages when the generator is directly connected to the transmission line is such that relatively few generators are so operated. The third reason is that circumstances have not favored the use of very high-voltage generators. Breakdown of 10,000-volt generators insulated with treated cloth has not been rare. The failures are due, first, to the chemical effect on cloth or paper of corona or static discharge that often accompanies the higher voltages, and, second, to the serious increase in dielectric loss that occurs in many cloth and paper insulations under the combined influence of high voltage and high temperature. The danger from corona is, roughly, a function of voltage alone; consequently high-voltage generators of all sizes are involved. The danger from dielectric loss is a function of both voltage and operating temperature; thus small generators with relatively low internal temperatures are immune while large turbo-generators in which the internal temperatures are usually in excess of 100 deg. are subject to this danger. With the higher generator voltages electrostatic stresses sufficiently high to break down air often occur, particularly at points and corners such as the edges of projecting laminations in the slots and the edges of the core ventilating ducts that are ground potential. The "static" or corona that results is accompanied by the formation of nitrous oxide and nitric-acid gases, which after a time disintegrate the vegetable insulation. On the other hand, mica is practically unaffected under conditions thus far encountered in practice and, so far as the author is aware, has never failed from this cause. Synchronous motors and generators are better adapted for the higher voltages than are induction motors.—

Sibley Journal of Engineering, Cornell University, May, 1918.

Generation, Transmission and Distribution

Bibliography of Petroleum.—Countries and regions in which petroleum is found are pointed out, and transportation, storage and distribution, properties of oil and their determination, utilization and legal regulation regarding its use are discussed.—*Bulletin* 149, Department of Interior, Washington, D. C.

Regulating Combustion in Modern Furnaces.—L. CONGER.—A consideration of this subject as applied to equipment with artificial firing and mechanical grates. The author lays particular stress upon the importance of proper ventilation. To obtain the necessary variation in the speed of ventilating apparatus in central stations using three phase current there are three processes to choose from: (1) To transform the three-phase current into direct current and to operate the ventilators by direct-current shunt motors; (2) to transform the three-phase current into two-phase current by a Scott transformer and to connect each phase to a monophase variable-speed motor, thus permitting an equilibrium of the two circuits; (3) to install three-phase variable-speed motors with collectors. The author favors, as the most flexible and economical method, the use of direct-current motors.—*Revue Générale de l'Electricité*, May 25, 1918.

Feeding Monophase Electrometallurgic Ovens from Three-Phase Distribution Systems.—E. PIERNET.—The author examines the means of avoiding disturbances produced when the conditions in electrometallurgical plants necessitate feeding monophase ovens from three-phase networks.—*Revue Générale de l'Electricité*, May 18, 1918.

Traction

The Loetschberg Railway.—LUCIEN PAHIN.—A long article on this electrified railway in the Bernoise Alps, Switzerland, which constitutes an international route to the Simplon tunnel and will be an important factor in traffic between the north of France and both Belgium and Italy. The section between Spiez and Brigue, extending 73.8 km. (45.8 miles), is described in detail, including the power houses, distribution system and electric locomotives, the latter of 2000 hp. and 2500 hp. Interesting figures regarding the energy consumption are given.—*Revue Générale de l'Electricité*, May 11, 1918.

Installations, Systems and Appliances

Repulsion and Mutual Inductance of Reactance Coils with the Same Axis.—H. B. DWIGHT.—The article contains curves and gives examples of how the inductance of reactance coils can be found by the use of the curves. The curves also indicate the mechanical forces which may exist between reactance coils. These are compared with test values.—*Electric Journal*, May, 1918.

Industrial Controllors, Part XVII.—H. D. JAMES.—This article describes controller systems for mine hoists. Mine hoists are divided into two general classes, namely, those for coal mines and those for metal mines. The equipment is classified as contactor controllers, liquid controllers and voltage controllers. Besides describing and illustrating these three types of controllers, safety devices and brakes are also considered. The question of whether the advantages of automatic control of hoists, designed to stop the cars at either limit of travel and discharge their load, is adequate to make up for the complicated design and extra cost involved is also discussed.—*Electric Journal*, May, 1918.

Wires, Wiring and Conduits

Solution of Polyphase Network Problems by Using Symmetrical Co-ordinates.—C. L. FORTESCUE.—The author points out that unsymmetrical systems of co-planar vectors may be represented by symmetrical systems of the same number of vectors, the number of symmetrical systems required to define the given system being equal to its degrees of freedom. In the first part of the paper, which consists of three parts, the author deals with the resolution of unsymmetrical groups of numbers into symmetrical groups. These numbers may represent rotating vectors of systems of operators. A new operator, termed the sequence operator, is introduced, which simplifies the manipulation. Formulas are derived for three-phase circuits. Star-delta transformations for symmetrical co-ordinates are given and expressions for power deduced. A short discussion of harmonics in three-phase systems is given. The second part of the paper deals with the practical application of this method to symmetrical rotating machines operating on unsymmetrical circuits. General formulas are derived, and such special cases as the single phase induction motor, the synchronous motor-generator and phase converters of various types are discussed.—Abstract of paper presented before A. I. E. E., June 28, 1918.

Electrophysics and Magnetism

Magnetization of Iron in the Absence of Hysteresis.—WINTHROP R. WRIGHT.—The magnetic characteristics of five steels, arranged in decreasing order of carbon content, were obtained at temperatures ranging from 20 deg. C. to the magnetic transformation point. The anhysteretic magnetization curve at a given temperature has three characteristics distinguishing it from the ordinary magnetization curves. The curve has no point of inflection, its slope at the origin is apparently infinite, and it does not intersect any other curve taken for a second temperature. Examination of empirical equations which have been proposed for anhysteretic magnetization showed that they represent the curve only very approximately.—*Michigan Technic*, May, 1918.

Electrochemistry and Batteries

Effect of Iron Sulphate in the Electrolytic Precipitation of Copper from Sulphate Solution with Insoluble Lead Anodes.—EDWARD F. KERN.—Solutions of copper sulphate containing varying quantities of iron sulphate were electrolyzed with insoluble lead anodes at different temperatures and with different current densities, in order to determine the effect of the iron salt present on the current efficiency of copper deposition at the cathode. The lowering of efficiency was found due

to adduction of ferrous sulphate to ferric sulphate at the anode, and reduction of ferric sulphate to ferrous sulphate at the cathode. Results are given quantitatively.—Extracted from paper presented before the American Electrochemical Society, April 28, 1918.

Experiments with the Copper Cyanide Plating Bath.—FRANK C. MATHERS.—Current yields at the cathodes were generally lower than those at the anodes, which necessitated the making of regular additions of sodium cyanide to the baths. Sodium carbonate and perhaps sodium sulphate are valuable additions. A more concentrated solution than usually employed is recommended because the higher current can be applied and the thicker deposits obtained without bad edges or corners and the cathode yields are higher.—Extracted from paper presented before the American Electrochemical Society, April 28 May 5, 1918.

Telegraphy, Telephony and Signals

Signals from Central Stations to Customers.—PIERRE TRICHARD.—The author proposes a system of signals to users of electricity based on very slight periodic variations of voltage above and below normal. By using the phenomenon of resonance these signals could be received upon a voltmeter or upon a combination of two voltmeters. Transmission of the time and the multiple recording of energy consumed are two of the uses to which they could be put. In addition, as has actually been done, they would provide a means of giving the alarm in case of a threatened air raid.—*Revue Générale de l'Electricité*, May 18, 1918.

Miscellaneous

Copper and Aluminum in Germany.—Discussing the statements made recently by an official of the British Aluminium Company, a leading German newspaper observes that it is no secret that Germany has embarked upon the production of aluminum on a large scale during the war, although opinions differ as to whether the German works will be able to meet international competition after the war. It is considered certain, however, that the reported increase in the British production of aluminum, proceeding simultaneously with a very large augmentation in the output of copper in the period succeeding the war, will render not improbable some overproduction of the latter metal. If the copper needs of Britain and her allies are estimated at 50,000 tons per month for war purposes, the German newspaper remarks that it is obvious that these requirements will be considerably reduced the moment peace is concluded. This circumstance is regarded as of importance to Germany, as the newspaper states that it awakens the hope that the present exceptionally high prices for copper will fall through this disproportion between supply and demand, and especially that there will be no question that it will be rendered possible for Germany to continue to obtain supplies of the indispensable copper.—*London Electrical Review*, April 26, 1918.

Welding Cast Iron with the Electric Arc.—Economies are being effected in railroad repair shops owing to the successful repair of expensive damaged castings. The article describes the preparation of the material for welding, particular attention being given to the welding of locomotive cylinders, high-pressure cylinders and thin metal that is not subject to heavy stresses.—*Railway Electrical Engineer*, May, 1918.

Measurement of Dielectric Losses by Condenser Bridge

To the Editor of ELECTRICAL WORLD:

Sir: In reading C. A. Butman's interesting article in your issue of March 9, describing the measurement of dielectric losses by the condenser bridge method, the writer's attention was drawn to several apparent errors. On page 502, in the paragraph headed "Formula for the Dielectric Constant," equation (6) is given as an expression for "the dielectric constant or specific inductive capacity." This is obviously an error. The dielectric constant is not a dimensional quantity; it is merely a ratio, as is evidenced by the qualifying adjective "specific." Equation (6) gives the capacitance of the author's condenser with air as the dielectric.

The discussion of the quantity $\cos \theta_r$ in θ_r of equation (12) is ambiguous because the author has apparently allowed r and c to vary simultaneously. In the paragraph on page 503 beginning "The experiments which follow show conclusively" it is stated that where $\theta_r = 90$ deg. there is an energy loss because the condenser has a perfect dielectric. Reference to Figs. 1 and 2 will show that θ_r becomes 90 deg. when the capacitance vanishes or the resistance r becomes infinitely large, constituting practically an open circuit, and the loss becomes zero on that account. On the other hand, θ_r becomes 0 when the condenser has a perfect dielectric with no energy loss.

In arriving at the conclusion on page 505 that "It was also found unnecessary to use a substitution method in measuring the capacity," it would appear that the author has eluded difficulties which have tried the souls of other experimenters when measuring capacitances as small as 0.0001 mfd.; but he has overlooked a splendid opportunity to secure the dielectric constant without being bothered with the calibration of his comparison air condenser. By taking a reading with his sample in place and then a second with the sample removed and his testing frame in air, the plates being set to give the same thickness of dielectric as in the first measurement, the dielectric constant is obtained directly as the ratio of the two readings of the variable resistance of the bridge. However, distributed capacitance is known to exist in resistance coils with the bifilar winding, and few inductors are free from this defect. Mr. Grover's article in the *Bulletin* of the Bureau of Standards points out that these residual capacitances enter directly into the value of dielectric loss obtained. Hence, if values of dielectric loss reliable to five significant figures are required, allowance for these reactances must be made or a substitution method employed. An equivalent of the substitution method could be easily secured by taking readings with the test apparatus used as an "air condenser" with two settings of thickness of dielectric. The best method is, of course, to use resistances of the Curtis coil type, which are very nearly anti-capacity.

Readers' Views and Comments

The author does not state the thickness of the metal plates used as electrodes nor does he make mention of the amount of pressure applied to the sample through the plates; hence it is impossible to estimate the degree of contact between the plates and the sample. It has been the experience of other experimenters that it is impossible to secure perfect contact between the sample and rigid electrodes even under great pressure, so that in testing these samples the measured dielectric constant is apt to be largely influenced by the dielectric constant of the medium in which the apparatus is placed. The Electrical Testing Laboratories use dish-shaped blocks of bakelite accurately aligned by dowels and clamped together with the sample between them. The space on either side of the dielectric is then filled with mercury, which constitutes the electrodes. A somewhat similar device is used at the Perth Amboy laboratory of the Standard Underground Cable Company. Incidentally, the writer knows that the latter company has been employing the bridge method for the measurement of dielectric losses for a number of years, and the results of such measurements by another investigator up to 6000 volts were published in the *Annalen der Physik* a good many years ago. GORDON THOMPSON.

Electrical Testing Laboratories, New York.

To the Editor of ELECTRICAL WORLD:

Sir: The following is a reply to the comments of Gordon Thompson relating to my article on the series inductance bridge.

1. The "formula for the dielectric constant," equation (6), is correct as given. The dielectric constant is the relation between the inductivity of a substance of certain dimensions compared to ether occupying the same space. Inasmuch as the dielectric constant of air is approximately unity, the specific inductive capacity is also given by the same formula.

2. It may make the expression $\cos \theta_r$ in equation 12 more clear to state that the change in r and c is due to a change in the material between the condenser plates. As long as there is no change in the material, r and c will remain constant. When the bridge is balanced there is one and only one value of r and c . If now we consider the hypothetical condition as to what would happen if r did change and c remain constant and vice versa, we will arrive at the given conclusion.

3. It is important to note that the exact mechanism of electric conduction is not known, and that there probably is a difference between a perfect resistance through which no conduction current passes and a perfect dielectric

which will transmit a displacement current. Further experiments are needed, such as tracing the change from a nearly perfect dielectric to that of a poor resistance by changing the temperature of a given substance.

4. Arranging the bridge symmetrically, reducing the capacity of the bridge to the ground to the lowest amount, grounding the bridge as shown in the diagram and placing the vibrator of the galvanometer directly in the circuit (the galvanometer itself being free from ground) showed that no auxiliary bridge like the one used by K. W. Wagner, or substitution method such as used by the United States Bureau of Standards, was necessary. The suggestion of having the galvanometer free from ground was due to Dr. P. Thomas of the Westinghouse research department.

5. Various ways of securing contact were tried, the most satisfactory being the testing frame developed. The brass plates of the frame were about $\frac{1}{8}$ in. (3.1 mm.) thick and were backed with wood so as to be rigid. The end of the micrometer screw was so made as to allow the top brass plate to adjust itself to the nearly plane parallel test samples. The amount of pressure used was sufficient to secure good contact. The method of testing the amount of pressure was the amount of force used in tightening the micrometer screw. The value of the dielectric constant of glass obtained with the bridge and the testing frame was what was to be expected, as judged from results obtained by other experimenters using other methods. It might also be well to point out that, while contact over the whole surface is essential in resistance measurements, in electrostatic (i.e., inductive) measurements it is not so important. It is believed by the author that contact is at a sufficient number of points to provide a good electrical connection. It should not be lost sight of that the testing frame provides a means of testing the dielectric constant of liquids.

6. In case 10,000 volts applied potential is used it is necessary to place the samples in oil to avoid dielectric losses due to corona. As is pointed out, if some other substance besides that directly under test comes into the electrostatic field between the plates of the frame it is liable to influence the value of the dielectric constant.

7. A series resistance bridge was developed by Monash (*Annalen der Physik*, 1907) for measuring the dielectric loss angle, but not the following improvements. The Einthoven galvanometer may perhaps be replaced by a Leeds & Northrup alternating-current galvanometer. The Ayrton-Perry type of variable inductance may be replaced with the less expensive Leeds & Northrup inductometer. The standard condenser made of plates immersed in mica.

A slight improvement could be made by using the Curtis type of resistances as recommended by Mr. Thompson.

CHESTER ARTHUR BUTMAN.
Rockport, Mass.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities in the Technical, Commercial and Manufacturing Fields

CENTRAL-STATION ECONOMIES DISCUSSED AT SYRACUSE

Engineers and Operators in New York State Tell
of Methods for Using Machinery and Material
in the Most Efficient Way Possible

That economies can and must be effected in war time was the keynote of the meeting of the Electric Section of the Empire State Gas & Electric Association at Syracuse on June 21. Delegates who have charge of production and distribution departments in central stations of New York State talked about the labor situation, fuel conservation, 11,000-volt distribution and other important problems that need immediate solution in order to "carry on" the central station in the best way. The member companies were well represented, and every one took part, a roll call being taken as the subjects were discussed.

The consideration of how to use material usually scrapped, especially old duct cable, which can be utilized by splicing, brought out the statement that in Buffalo the later method had been practiced for fifteen years with great success.

It was pointed out how on the Syracuse system an 11,000-volt emergency line had been arranged so that it could be used for a 2300-volt tie line and switched back to its original use if necessary. By this method the energy from the water-power station could be better distributed and considerable generation by steam was eliminated. By utilizing a 250,000-circ. mil cable that happened to be in stock on a distribution system where B. & S. gage No. 0 was the size required feeder regulators and the necessity of buying cable of the correct size were eliminated in Rochester. At Syracuse one man is employed to repair transformer leads and bushings, and by this means the equipment is kept in first-class condition and it is not necessary to send transformers to outside shops except in rare cases.

WOMEN IN INDUSTRY

A discussion of the labor situation brought out the fact that many women were being employed by the member companies with satisfaction. In Buffalo seventy-three girls are being used in the office, where before the war only one woman was employed.

Testing, repairing and reading of meters is accomplished very efficiently in Binghamton. This work is greatly facilitated, however, by the fact that for several years the local company has required the meters to be placed in a central position on the consumer's premises and not much difficulty is encountered in reaching them. It was suggested that the central stations should study the possibility of employment of disabled soldiers in plants and in testing rooms in accordance with the request of the government.

In discussing fuel conservation one engineer told of a case in which the Fuel Administration had written to

the owner of an isolated plant asking him to communicate with the central station to make an arrangement whereby the latter company could take over its load. The Fuel Administrator in Rochester has issued an order requiring that no gas or electric service shall be connected to the lines without his permission.

The effect of daylight saving was discussed by all the companies represented, and in some cases it was stated that plans were being made to induce factories to change working hours so that the peak of the commercial load could be shifted and would not coincide with the lighting load.

Obtaining right-of-way is the greatest trouble met with in serving customers from the rear lot, according to several engineers. In addition, when street lights have to be served from the same primaries considerable underground construction cannot be avoided.

Modern apparatus accounts for efficient operation of the steam station in Rochester, said one of the production engineers of that company. Bonus systems are used for increasing the operation in the engine room and boiler room in this plant.

Farmhouses along 11,000-volt lines can be served economically if the load of several consumers is sufficient to require at least a 5-kw. transformer. All that is required for protective means is fuses and choke coils on the transformer pole. In case lightning strikes the line the reactance of the transformer will choke the discharge back to the substation lightning arresters.

SCOPE AND APPLICATION OF NATIONAL SAFETY CODE

Circular No. 72 Issued by the Bureau of Standards
Intended to Aid Those Interested in
the Code

Circular No. 72 issued by the Bureau of Standards deals with the "Scope and Application of the National Electrical Safety Code." This circular is intended to aid those to whose attention the safety code has been called and those who are contemplating its adoption or use in acquiring the necessary familiarity with intent and scope. The need for the code is explained and examples of personal injuries by electricity are given, most of which will be found avoidable by observance of the rules.

The method of arrangement of the code to promote convenient use and the intended manner of application of the code by engineers and inspectors are briefly explained. A short summary is also given of the provisions of each of the four principal parts of the code. According to an announcement issued by the bureau, as the code is being adopted on trial by many administrative bodies and public utility companies, it is expected by the bureau that this circular will facilitate its introduction and aid in its interpretation.

Motor-Operated Bell Chime at Boston Store

Electrical advertising by a bell chime connected with a master clock is effectively utilized at the Filene Store, Boston, Mass., on the busiest street corner in New England. Four bells constitute the chime, which rings on the hours and half-hours according to the Westminster schedule. The chiming and striking are accomplished by an electrically controlled let-off tower clock mechanism installed in a corner of the store behind the bells. The mechanism is controlled by a regulator wall clock which also energizes the magnets in the movement of the bracket clocks. The magnet control current is supplied by Samson batteries.

WATER-POWER COMMITTEE AGREES ON A NEW BILL

Special Committee of the House of Representatives
Decides to Recommend Legislation Similar
to Administration Bill

The special committee appointed in the House of Representatives to consider all proposals for water-power legislation has completed its work and has agreed upon a bill which will be presented to Congress probably early in July. The bill is practically identical with what was known as the administration water-power bill, which was made the subject of hearings that have been reported in the *ELECTRICAL WORLD*.

In its essential features the bill provides for a federal power commission consisting of the Secretaries of War, Agriculture and the Interior. The President is to designate the chairman of the commission, which is to issue licenses for the development of water-power projects, the term of the license not to exceed fifty years. Licenses may be altered only upon mutual agreement between the licensee and the commission after notice of thirty days.

The licensee is to pay the United States "reasonable annual charges in an amount to be fixed by the commission." The original provision of a charge of not less than 10 cents per horsepower-year has been eliminated, and provision has been made for the readjustment of the charges at periods of not less than ten years in case the project includes dams owned by the

United States. Licenses may be issued without charge for small projects of not more than 50-hp. capacity. In case licenses are issued to states or municipalities charges are not to be assessed on such power as may be used directly by the licensees.

Provision is made whereby the United States may recapture the project upon not less than two years' notice from the commission by paying to the licensee his net investment plus reasonable severance damages for property of the licensee not taken. The original definition of net investment is retained. The bill also contains the original options regarding the disposition of the project at the end of the fifty-year license period and relating to the regulation of rates of service and character of securities.

A new provision was written into the bill requiring the licensee to maintain out of surplus earnings, if any, accumulated in excess of a specified rate of return upon the net investment, amortization reserves to be held until the termination of the license or applied periodically in reduction of the net investment. The license may provide that any balance or surplus earnings shall be used in reduction of rates and annually returned to the consumer.

INCREASING FACILITIES TO MEET WAR-TIME DEMANDS

New England Power Company Expects to Expand
Its Total Rating by 40,000 Kw. Before Next
Winter, Partly by Interconnection

Forty thousand kilowatts of additional capacity will be available before next winter on the system of the New England Power Company to meet the demands of war industries, according to plans outlined by President Henry I. Harriman on June 20. This increase will in part be secured through interconnection with the lines of the Shore Line Electric Railway in Connecticut and with the system of the Edison Electric Illuminating Company of Boston at Dedham, Mass., supplemented by the addition of a 12,500-kva. steam turbo-generator and four boilers to the central station at Uxbridge, Mass., by the rewinding of the generating units in the No. 5 hydroelectric station of the power company near the Massachusetts-Vermont line on the Deerfield River, and by the addition of new boilers to the plant of the Narragansett Electric Lighting Company of Providence, R. I.

Mr. Harriman stated that at present the New England Power Company's entire output of hydroelectric energy is being sold. The increasing demands for power in industrial New England resulting from war activities render it absolutely necessary to procure 40,000 kw. in addition to present available capacity before winter. The high cost of equipment and construction renders it essential to combine resources as fully as possible, conserving both capital and fuel. The Shore Line Electric Railway of Norwich, Conn., which has a central-station business in that district, is building a new plant of 25,000-kva. rating on the Thames River, about halfway between New London and Norwich. This will supersede four or five small and inefficient steam plants now operating the road, some of which consume in excess of 4 lb. of coal per kilowatt-hour. These stations are interconnected by 33,000-volt lines. It is proposed to build a new line connecting the Shore Line

system with the New England Power Company's dispatching headquarters at Millbury, Mass., just outside Worcester, the New England company building that part of the line between Millbury and the Connecticut boundary, at an estimated cost of about \$102,000.

This interconnection will enable the Power company to utilize the reserve capacity of the new Shore Line plant, which is equivalent to the rating of one 12,500-kva. unit, the initial installation providing for two turbines of equal capacity. This station is now under construction by the Harry M. Hope Engineering Company of Boston, piling and foundation work being in process. Mr. Harriman said that the total load of the Shore Line company is about 7500 kw., and that the construction of the new plant was hastened by the high cost of coal and by the necessity for supplying energy from the Shore Line plant to a boat-building establishment at New London. It has been agreed that if the Shore Line company will build a transmission line from its present system to the Massachusetts state line the New England company will purchase energy from the former for probably more than six months of every year, and the Power company will also supply the Shore Line load from midnight to morning, this totaling about 1000 kw. and being too small to permit of the economical operation of a 12,500-kva. unit.

ARRANGEMENT AT PROVIDENCE

Arrangements have been made with the Narragansett Electric Lighting Company, Providence, R. I., to install four additional boilers at the main generating station on tidewater at Providence, thus providing 10,000 kw. not previously available and enabling the full turbine capacity of this company to be utilized. The interconnection with the New England system through the Rhode Island Power Transmission Company, the affiliated organization's line, will enable energy to be interchanged as may be required. The Providence station is at present the largest steam plant connected by high-tension lines with and supplying energy to the New England system. It is now planned to tie the latter into the Boston Edison system by the construction of a 19-mile (30.5-km.) high-tension line from the Sudbury hydroelectric plant of the Metropolitan Water & Sewerage Board to the Dedham substation of the Edison company. This line is to be designed to transmit from 10,000 kw. to 15,000 kw. in off-peak energy. This interconnection will call for the laying of another cable between the Dedham substation and the L Street station of the Boston company, and it is expected that these interconnections will be permanent and useful after the war as well as at present.

Recently the New England Power Company was offered a 12,500-kva. steam turbine for immediate delivery, the manufacturers having received a cancellation order from another purchaser. The unit was at once accepted, and shipped for installation at Uxbridge, where the existing central station is interconnected with the hydroelectric system. Four 500-hp. boilers have been purchased, and to provide for this equipment the boiler house will be extended 60 ft. (18.2 m.) and the turbine room 30 ft. (9.1 m.). The turbine was purchased at a cost of about \$201,000, and could not have been obtained for service this fall had it been ordered in the usual way.

At the No. 5 station of the Power company three double units are in service, delivering 25-cycle energy at one end for the Hoosac Tunnel electrification of the Boston & Maine Railroad and 60-cycle energy at the other for general use. These machines were installed about six years ago. Mr. Harriman stated that, like many units of earlier build, these generators were designed along very liberal lines with respect to material. Recent advances in insulation practice have made it possible to increase the output of many units by rewinding. The company needs additional peak capacity, and it has been ascertained that by installing new coils the capacity of the three units can be increased by a total of nearly 6000 kva., and at a cost of \$3 per kilovolt-ampere for the coils alone. Other changes in the station bring the estimated cost of the enlargement to \$83,765. A new 6000-kw. unit would cost around \$20 per kilowatt at present prices, and at least \$10 per kilowatt two or three years ago. If a new unit were to be installed it would be necessary to enlarge the station building and provide new gates and a new penstock. The present waterwheel is large enough in each case to drive the double generating set connected to it, even after rewinding the coils.

Mr. Harriman said that prices of electrical equipment are nearly double those of two years ago and that the labor cost in installation often equals the cost of the equipment itself to-day, or nearly so. Most of the construction work of the Power company, together with the engineering, is performed by the affiliated Power Construction Company, only a nominal profit being sought to cover actual costs. This arrangement is convenient in view of the doubtful authority of the Power company to act for other companies as an engineering or construction organization, especially on work outside the State. The New England Power system is being connected with the Fall River Electric Light Company by an 18-mile (28.9-km.) line, under construction for the Cabot interests of Boston by F. T. Ley & Company, and as this organization is working in the vicinity of Rhode Island, it is also being utilized in a short piece of line work in the latter State.

SUMMARY OF ESTIMATED (NOT ACTUAL CONSTRUCTION) COST OF ENLARGING FACILITIES OF NEW ENGLAND POWER COMPANY.

1. Uxbridge station, increasing capacity by 12,500 kva..	\$768,500
2. Plant No. 5, increasing capacity from 12,600 kva. to 18,100 kva.	83,765
3. Pole line, single-circuit No. 1 coffer, 15 miles, Millbury to Connecticut State line.....	102,300
4. Additional switching equipment, Millbury substation..	4,200
Total	\$958,765

When asked about the prospect of constructing the Davis Bridge Reservoir, in Vermont, Mr. Harriman said that at present it is out of the question to raise the necessary money by private capital, but that the additional storage is greatly needed, and, with the 112,000,000-kw.-hr. it would furnish annually, would be the salvation of the New England power situation. A bill has lately been drawn by Counsel Buckley of the Council of National Defense appropriating \$200,000,000 for the use of the President of the United States on behalf of public utilities in such manner as he deems wise. It is hoped that New England will share in the benefits of this proposed act of Congress.

ELECTRIC POWER CONDITIONS IN THE DOMINION OF CANADA

Canadian Electrical Association Discusses Pressing
Needs of Central Sections of the Country Now
Enjoying Unprecedented Activity

The twenty-eighth annual meeting of the Canadian Electrical Association, which is affiliated with the National Electric Light Association, was held at the Chateau Laurier, Ottawa, on June 21. Considering the condition of electrical industry in Canada, the attendance was quite large, the central stations of the Dominion being seriously handicapped by labor shortage in the face of activity unprecedented in the history of the lighting companies. At the present time there is also a great shortage of power throughout the Province of Ontario, but the power conditions in the Province of Quebec are not quite so serious. It should be noted that from ocean to ocean the great centers of industry are supplied with electrical energy generated from water-power stations. In the eastern sections, notably in Hamilton and Montreal, large steam reserve stations are maintained, and inasmuch as nearly all the coal is obtained from the United States, the coal shortage of the Republic affects Canada as well. The tendency, therefore, is to load up the existing hydroelectric developments to the limit.

CONDITION OF CANADIAN UTILITIES

The general conditions obtaining in the central-station industry throughout the eastern section of Canada were reflected in the address of D. H. McDougall of Toronto, the president of the association. Difficulties in obtaining coal and money are apparently as common in Canada as they are in the United States, and the necessity for higher rates is just as pressing. Speaking of the immediate problems, Mr. McDougall said:

"The war and its accompanying sacrifices and hardships have made it necessary that each one of us should assume additional burdens and responsibilities. Our industry has had imposed on it additional duties in the way of operating problems and overloads that required all the skill, nerve and ingenuity that we could muster, and our staffs have been depleted further by conscription and the other war drains, making the maintenance of service a very difficult matter.

"Few of us are able to finance any new extensions to our properties or maturing bond issues. This handicap has been largely met by charging customers the cost of line extensions and by intensifying loads on present lines. Station increases have been almost impossible to finance. In some quarters this has been offset by taking on off-peak business, and this has required the study of factory conditions to educate customers to the necessity and possibility of such methods of operation. The result has been that higher load factors are experienced and some plants have been operated at a load factor deemed impossible even two or three years ago.

"The next difficulty has been with our employees, whose numbers have been decimated by military service, to which they have willingly responded, and by conscription, which I believe has affected us so far in a minor degree.

"I think I am safe in saying that great disorganization on account of these wholesale changes in staffs

has only been averted by the loyalty and unselfish performance of duty of those who for one reason or other were unable to answer the call of the bugle.

THE HYDROELECTRIC POWER COMMISSION

"The outstanding example of failure to live up to contract obligations in the service of electric power in Canada during the past year is the case of the Hydroelectric Commission of Ontario, which, with an unprecedented lack of foresight, made contracts for larger amounts of power than it was able to supply. The total amount of this shortage has been stated to be 100,000 hp., but, unlike the members of this association, the commission has so far been able to escape the consequences of this selling short of power, as it has refused to recognize the claims of its customers, based on the solemn contracts signed by it, and has pleaded that its shortage has been caused by the war.

"It is hard to believe that such immorality would be protected by the crown and that millions of dollars invested in plants depending on government contracts for their power should be shut down when many of them would otherwise be turning out munitions and other war necessities but for this breach of faith.

"This commission, in spite of its lack of business ability, is able to secure large sums for construction work, amounting to about \$2,000,000 a year, because its undertaking is supported by the government, although the works it is building cannot be of any service to the country for years to come, long after the war will surely be over. In the meantime it is diverting this money so much needed for war purposes from the use of the people of Canada. The amount of money expended by the Hydroelectric Commission so far in transmission and distribution plants is about \$70,000,000, and the estimated amount of taxes lost to the people, which they would collect from privately owned companies with similar properties, is about \$1,500,000 per year."

Other speakers at the morning session were T. C. Martin, secretary of the National Electric Light Association, who spoke of the work of the national body for the year and of its war committees; Willis MacLachlan of Toronto, who spoke on accident prevention, and with the assistance of operators from the Ottawa Electric Company, gave a demonstration of resuscitation from electric shock; A. A. Dion of Ottawa, whose report for the overhead-line committee dealt chiefly with the grounding of high-tension and secondary circuits, and J. F. Nield of Toronto, who reported on electrical apparatus.

Four reports were made at the afternoon session, all of which were commented on. William Volkman of the Toronto Power Company reported on the changes made during the past year in the manufacture of meters. A part of the report was devoted to the determination of power factor, because with the load conditions and the extremely high cost of additions to line capacity any relief which might be obtained by improving the power factor of consumers' loads is of great importance. Three methods for determining the power factor of loads were outlined in detail.

H. E. Randall of Montreal reported on the commercial light and power sales and on the use of electricity during the past year. The great value of the central-station industry to the country and the important part

it is accomplishing in the production of munitions, in solving the servant problem, in the conservation of fuel, man power and material, and in building up industrial conditions of Canada, were described in detail.

As the Canadian Electrical Association's representative on the National Electric Light Association's lighting sales bureau, E. N. Hyde of Montreal reported on industrial lighting conditions.

A very interesting report was presented by P. T. Davies of Montreal on rate research. It was pointed out that the obligations of customers in Canada to provide themselves with suitable electrical apparatus have been increased in view of the shortage of power and the high cost of machinery. Nearly all companies are requiring customers to keep power factors within reasonable limits at all times and to pay for any deficiencies. An abstract of the report of this committee will be published in a later issue.

Officers for the coming year were elected as follows: President, A. Monro Grier, Canadian Niagara Power Company, Toronto, Ont.; first vice-president, E. A. Dunlop, Pembroke (Ont.) Electric Light Company; second vice-president, C. S. Bagg, Montreal Light, Heat & Power Company, Cons.; third vice-president, A. P. Doddridge, Quebec Railway, Light, Heat & Power Company; secretary-treasurer, W. Volkman, Toronto Electric Light Company. The managing committee comprises D. H. McDougall, Toronto Electric Light Company; J. S. Norris, Montreal Light, Heat & Power Company, Cons.; P. T. Davies, Southern Canada Power Company, Montreal; R. B. McDunnough, Quebec Railway, Light, Heat & Power Company; J. S. Gould, Citizens' Electric Light Company, Smith's Falls, Ont.; H. M. Hopper, St. John (N. B.) Railway Company; L. Pratt, Dominion Power & Transmission Company, Hamilton, Ont.; J. B. Woodyatt, Southern Canada Power Company, Montreal; W. H. McIntyre, Ottawa Electric Company; R. J. Beaumont, Shawinigan Water & Power Company, Montreal; H. E. Randall, Shawinigan Water & Power Company; A. V. Gale, Hull (Que.) Electric Company; J. F. Nield, Toronto Electric Light Company, and the president of the N. E. L. A.

The proceedings ended with a banquet in the Chateau Laurier at which seventy-five were present. Addresses were made by the incoming president, A. Monro Grier, D. H. McDougall and John Murphy, electrical engineer of the Dominion Railway Commission.

BANKERS WORKING ON PUBLIC UTILITY RELIEF

Committees in Large Cities Take Up the Question of Providing for the Necessary Financing Requirements

In last week's issue of the ELECTRICAL WORLD the appointment of four New York bankers to consider public utility needs was reported. Committees are also being appointed in other cities with the idea that each local situation may be met directly in the community. In Philadelphia the committee is J. R. McAllister, John H. Mason, Effingham B. Morris, Arthur E. Newbold, Levi L. Rue, Joseph Wayne, Jr., and William P. Gest, chairman. The Chicago committee is George M. Reynolds, E. D. Hulbert and Frank O. Wetmore. A similar committee exists in Boston.

LABOR ARBITRATION IN GENERAL ELECTRIC PLANT

Company and Employees at Schenectady Works Agree to Submit Differences to Ex-President Taft and Frank P. Walsh

The Department of Labor announced at Washington on June 23 that the General Electric Company and 21,000 employees at the Schenectady works have agreed to submit differences to arbitration by ex-President William H. Taft and Frank P. Walsh, joint chairmen of the National War Labor Board. The company expressed a willingness, before arbitration was agreed upon, to increase wages 10 per cent; employees asked 25 per cent. The Department of Labor says:

Their agreement, signed by representatives of the company and of the men, binds both sides to abide by the decision of the arbitrators, whatever it may be. Intervention by the two chairmen of the board prevented a strike at the plant, it was brought out at the hearing. The men had voted to go out, but reconsidered the action when they were assured that the War Labor Board would assume jurisdiction.

Their demands are a 25 per cent increase in wages throughout the plant, which is 100 per cent organized; the application of the basic eight-hour day; modification of the physical test; equal pay for equal work, whether performed by men or by women, and an agreement by the company that such wage increase as may be granted shall be retroactive to May 1. The company demurred on the question of a retroactive increase, but agreed to it after the employees waived the point previously raised against the physical test.

Approximately 2800 women are employed in the plant. No complaints were made by the employees against the treatment they had received at the hands of the company. On the other hand, they praised the fairness of the officials, their willingness to meet with committees representing the workers at all times, as well as the cleanliness and general safety of the plant itself. They maintained their desire to serve the country by steady application to their tasks and offered only the arguments presented by many briefs and statistics that many of them are not receiving sufficient pay to make them able to meet the increased cost of living. It was brought out that all of the employees are owners of Liberty bonds.

WE HAVE just begun to appreciate the possibilities of social progress that lie in highly organized, genuinely co-operative industry and what is now called quantity production. The essential thing is to get everybody interested in the possibilities of increased production instead of in the paralyzing agitation which lays all emphasis upon the division of the product. If the commodities of trade which minister to the comfort and welfare of the people are produced in greater quantities and more economically than ever before, there is not the slightest doubt that there will be a broad distribution of them. Everybody who produces them will be striving to distribute them, and if the increase is in all kinds of products everybody will have something to give in exchange for the property or service of others.—*National City Bank, New York.*

MEETING OF THE N. E. L. A. SOUTHEASTERN SECTION

In the Atlanta Convention War-Time Questions Predominate—C. D. Flamigen, Athens, Ga.
Elected President

The meeting of the Southeastern Section, National Electric Light Association, was held on June 19 and 20 at the Piedmont Hotel, Atlanta, Ga. Each day's session was opened by the singing of the "Star-Spangled Banner," and each talk had interwoven with it some reference to the world-wide war.

The first day's session was opened by a talk from Rabbi David Marx of Atlanta on "What the Public Expects of Public Utilities." He stated that the times are changing so rapidly that it is hard for an ordinary man to keep pace with the general changes and it must be without question exceptionally hard for the professional man to keep abreast with the times and still keep up with the changes in his profession. A compliment was paid to the men of the central stations who have not only carried on their work but have responded liberally with their own time and their companies' resources whenever the government has called upon them. Where a public corporation has a monopoly the public is entitled to a dividend, these dividends to be paid in service. The company is entitled to dividends to be paid in money. He further stated that the public does not object to pay a fair profit on service which it buys. The question which is raised between the public and the public utilities company is therefore not what is profit but what is a fair profit.

W. H. Glenn, Georgia Railway & Power Company, Atlanta, spoke on "Some of Our War-Time Difficulties." Mr. Glenn stated that the central-station, although a manufacturer, still could not be properly classed with the ordinary commercial manufacturer. The ordinary manufacturer, when the burden is thrown upon him to increase his output, may either lengthen the hours of his labor or may run two or more shifts, thereby increasing his output without a material increase in overhead. Moreover, should a burden of government work be thrown on an ordinary manufacturer, he can be relieved from supplying his other customers. These customers may object, but when the situation is explained they, as a rule, will not make serious opposition. With the central station it is practically impossible to state just when the load will come on; and when the ordinary business has imposed on top of it government work—that is, power and light to war industries, such as new munition plants, cantonments, etc.—the central station cannot reduce facilities voluntarily for serving other customers.

Mr. Glenn stated that from ten hydroelectric companies in the South there was sold approximately 1,500,000,000 kw.-hr. This is generated entirely from water power, which in turn saves a thousand trains, of seventy-five cars each, of coal. He further stated that he did not believe that public utilities at the present time were asking permission to raise their rates in order to make a profit, but that they were desirous simply to break even.

John W. Lieb, vice-president New York Edison Company and president of the National Electric Light

Association, made a talk on "The N. E. L. A.—Its Work in Peace and War."

Mr. Lieb explained the workings of the different committees of the association and also the problems which they had been called upon to solve during the last twelve months. He also explained the formation of the National Committee on Gas and Electric Service.

L. K. Comstock, New York, spoke on "A Proposed System of Wage Adjustment." Mr. Comstock showed by a series of tables that it was possible to base wages on a certain definite sum and that wages could be adjusted from time to time in order to take care of the rise and fall in the cost of living.

The session of June 20 was opened by E. H. Sniffin, who spoke on "Co-operation Between Manufacturer and Utility." Mr. Sniffin stated that the output of central stations increased about 100 per cent every five years and that the expenditures increased in about the same ratio. He said that during the same period the average man had almost doubled his consumption of electrical energy, but it had cost him only 20 per cent more than the original amount. He said also that in 1902 there was for every \$100 of capitalization about \$75 invested. In 1912 for every \$100 capitalization there was \$100 invested. In 1917 for every \$100 capitalization there was approximately \$125 invested. He stated that he believed the solution of the manufacturers' cost problems lay in the straightening out of their annual sales curve. He also recommended that a system of progress payments be inaugurated similar to that used by the builders' trade.

The report of the committee on public policy was read by the chairman, John S. Bleecker, vice-president Columbus (Ga.) Power Company. After the reading of this report there was a general discussion regarding rates and policies of the different companies.

REPORT OF PUBLIC POLICY COMMITTEE

The committee reviewed the development of public policy, suggesting that its real function is to discover the policy of the public and that it should be called "the public's policy committee." To-day, the report added, the industry is recognized, as it surely must have become recognized sooner or later with or without the war, as a national necessity.

After referring to the support given to the utilities by President Wilson, Secretary of the Treasury McAdoo and Comptroller of the Currency Williams, the committee said:

Our real American public wants nothing so much as "fair play," and, if we recognize the fact that we are not free agents to do as we please with our properties but that we must follow the public's policy, we shall be upheld and supported by enlightened regulating authorities and made to be in fact as well as in name a vital, necessary cog in the national wheel, which, slowly but surely, firmly but fearlessly, patiently but persistently, is grinding a path toward world liberty and perpetual peace.

The following officers were elected to serve during the ensuing year: President, C. D. Flamigen, Athens, Ga.; first vice-president, George W. Wygant, Tampa, Fla.; second vice-president, S. B. Ireland, Montgomery, Ala.; executive committee, W. R. Collier of Atlanta, L. Newman of Birmingham, D. H. Cheney of Orlando, Fla., H. H. Carr of Raleigh, N. C., and C. M. Benedict of Charleston, S. C.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Employee in Interstate Service.—An employee injured while working on a main power line carrying alternating current to substations, which converted it to direct current for operating cars in interstate commerce, was not injured in interstate commerce, his employment being too remote, the Supreme Court of California held (171 P. 1071).

Change of Rates by Receiver.—The courts of the State have no jurisdiction to appoint receivers for the purpose of regulating the rates of public service corporations, and neither the courts nor the receivers of such corporations have jurisdiction to change legal rates without the consent of the Public Utilities Commission, but when the legal rates charged by the receiver of a public service corporation have been enjoined by a court of competent jurisdiction the receiver may put into effect rates to be charged until the commission establishes a new rate, the Supreme Court of Kansas held (172 P. 713).

Negligence of Fellow Employee.—One dealing with and transmitting a dangerous and deadly electric current, whenever reasonably chargeable with knowledge, or when the facts are such as to make it reasonably probable, that persons may lawfully come near its wires and be exposed to danger therefrom, must take every precaution accessible to obviate the danger of injury and must use the utmost care to keep and maintain the wires so as to prevent injury, the Kansas City Court of Appeals held in *Ratliff versus Mexico Power Company* (203 S. W. 232). In an action by the widow of an employee in a city laundry who, while in the city's power house under permission of its superintendent, was killed when a laundry pipe held by another laundry employee who was attempting to open the door of the power house came into contact with defendant's wires transmitting power to the power house and, establishing a contact, caused a fatal injury while deceased was lifting the latch to open the door, it was held on the evidence that defendant was negligent in not insulating its wires so as to prevent such contact. In such case the deceased was not a trespasser at the time he was killed; the negligence of deceased's fellow-servant in establishing a contact with defendant's transmission wire could not be imputed to the deceased, and furthermore the negligence of deceased's fellow-servant would not absolve defendant if its negligence concurred with that of the fellow-servant in causing death.

Reasonableness of Rate Order.—Evidence in the record examined in connection with the objections urged as to the values fixed by the commission being held to support reasonably the findings of fact as to values, and the presumption being that such order is reasonable, just and correct, the order must be affirmed, the Supreme Court of Oklahoma held in *Comanche Light & Power Company versus Turner* (172 P. 792).

Interference with Telephone Lines.—Under the laws authorizing the construction and maintenance along highways of electric transmission lines, but expressly providing that such a line shall not interfere with the service of telephone or telegraph lines already constructed on such highways, whether such a transmission line is properly or improperly constructed and operated is immaterial where interference with existing telephone or telegraph lines is shown, the Supreme Court of South Dakota held in *Tri-County Mutual Telephone Company versus Bridgewater Electric Power Company* (167 N. W. 501). The law adopts the rule that priority of time carries with it priority of right. Injunction is a proper remedy for a telephone line against a subsequently erected electric transmission line to enforce the protection against interference with operation given by express provision of Laws of 1913, Chap. 369, the telephone company not being restricted under the statutes to an action for damages from such interference.

Injuries from Dam Construction.—The Laws of 1907 provide that in case it shall be necessary to take, flow or injure any lands or property for the purpose of the construction or use of a dam the licensees shall be subject to the provisions and entitled to all benefits and remedies of the Statutes of 1898, paragraphs 3374-3406. Section 3 provides that for acquiring the necessary lands or rights, easements or privileges in lands necessary for the complete and successful construction of the dam and improvement of navigation the said licensees may enjoy the rights granted to corporations by the Statutes of 1898, paragraphs 1777-1777e. Paragraph 1777e provides that such corporations may acquire title to necessary lands or easements by purchase or lease or by eminent domain, and in case it shall be necessary to take, flow or injure lands and property, such lands and property or easements therein may be acquired in the manner prescribed by the statutes with reference to condemnation by railroads. The Supreme Court of Wisconsin (167 N. W. 445) held that a power company is liable for injury to lands made permanently unfit for agricultural purposes by the backing up of water by its dam, as well as for lands actually overflowed, the word "injure" being used in its popular sense, namely, an act resulting in damage. In authorizing power companies to erect dams the state may impose such terms as it chooses and the licensees must conform to them.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

A. I. E. E., Fort Wayne Section.—P. C. Morganthaler was elected chairman and O. B. Rinehart was elected secretary of the Fort Wayne (Ind.) Section of the American Institute of Electrical Engineers on May 31.

Jovian Electric League, Los Angeles.—John S. McGroarty gave an address at the June 12 meeting of the league on "The Patriots of Power." C. H. Pierson, advertising agent of the Southern California Edison Company, acted as chairman of the day.

A. I. E. E., Philadelphia Section.—J. H. Anderton presented an illustrated address on "The Big Creek Development of the Southern California Edison Company" before the Philadelphia Section of the American Institute of Electrical Engineers recently.

American Drop Forge Association.—At the fifth annual meeting of the American Drop Forge Association at Buffalo on June 21 Arthur D. Farr, sales manager of the Hess Steel Corporation, Baltimore, Md., presented a paper on "Electric Steel Making."

A. I. E. E., Washington Section.—For the coming year J. E. Smith has been elected chairman and Milton Flinders secretary of the Washington Section of the American Institute of Electrical Engineers. Motion pictures on "The War and the Electrical Industry" were shown at the last meeting.

Tri-State Water and Light Association.—The eighth annual convention of the Tri-State Water and Light Association of the Carolinas and Georgia was opened on June 13. Among the speakers at this three-day session were Thomas Fuller, T. W. Moore and C. H. Cabnett of Atlanta and J. E. Guilford of Macon.

Mississippi Electric Association.—H. F. Wheeler, general manager of the Hattiesburg Traction Company, was elected president, and L. O. Gordon, general manager of the Jackson Light & Traction Company, was elected secretary and treasurer of the Mississippi Electric Association at the annual meeting, held at Hattiesburg May 23 and 24.

Recommendation of I. E. S. Committee on Nomenclature and Standards.—A meeting of the committee on nomenclature and standards of the Illuminating Engineering Society was held recently in New York. As a standard value for the mechanical equivalent of light the figure 0.0015 watt per lumen is recommended. A sub-committee was appointed to prepare a recommendation regarding the proper crossing point of spectrophotometric curves.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Plot Rumored at Cleveland.—Timely discovery of two dry boilers at the municipal light plant at Cleveland, Ohio, on June 11 prevented an explosion. The other three boilers in the battery were flooded. A water tender, in the employ of the plant only a short time, disappeared. Detectives working on the matter hint in their reports at a German plot.

Cleveland Municipal Power Rates to Be Increased.—Light Commissioner W. E. Davis has announced that, effective July 1, the power rates charged by the municipal light plant of Cleveland, Ohio, will be increased. The increase will cover merely the increase in cost of production, he said, and no attempt will be made to secure a profit. Long-time contracts have stood in the way of such a step heretofore.

Lexington Franchise Amended to Increase Rates.—The Board of City Commissioners of Lexington, Ky., at a recent meeting approved a "rider" to the franchise of the Lexington Utilities Company permitting an increase of 20 per cent in commercial and power rates to all consumers. The company officials state that the charge is a war measure and is necessitated by increased cost of production.

Furnace Makers to Aid in Conservation.—Representatives of the stove and furnace manufacturers have been conferring with the conservation division of the War Industries Board regarding a program that is necessary to meet war conditions and promote the saving of iron and steel, fuel, transportation and labor. The furnace manufacturers have already suggested action which would mean a reduction of 75 per cent of the styles and sizes of furnaces now on the market.

Controversy at Paris, Ky., Gets Into Court.—Because the city had not paid its light bills for three months, the Paris (Ky.) Electric Light & Gas Company discontinued connections with the city rock quarry, city hall and fire department on June 11. A temporary restraining order was issued by the Bourbon Circuit Court. The company is operating without a contract, and the city claimed that its rates were unreasonable. This was given as a reason for withholding payment of the bill.

Cleveland Rate Case.—On June 20 the Ohio Supreme Court ruled that \$1,112,070 shall be deducted from the valuation of the Cleveland Electric Illuminating Company property, as fixed by the Public Utilities Commission. This means that the service rate will be based upon a valuation of \$18,549,172, instead of \$19,661,242, the latter being

the figure fixed by the commission. The deduction was made from the amount allowed by the commission for attaching business. All other portions of the valuation were sustained.

Rate Advances at Bylesby Properties.—Since Sept. 1, 1917, increased rates for utility service have become effective at 297 communities served by the following properties managed by H. M. Bylesby & Company: Fort Smith Light & Traction Company, Mobile Electric Company, Northern States Power Company, Oklahoma Gas & Electric Company, Ottumwa Railway & Light Company, Puget Sound Gas Company, San Diego Consolidated Gas & Electric Company, Tacoma Gas Company and Western States Gas & Electric Company.

Optical Glass Supplied Here.—At present, as a result of co-operation between the manufacturers and scientists, large quantities of optical glass of the kinds needed for military fire-control instruments are being produced of a quality equal in practically every respect to the best European glass. The need for a continuous and assured supply of optical glass is so great that the workmen trained in the details of manufacture and subject to draft are being withheld in order that their technical training may be utilized at this time. The required information and details of manufacture and the skill necessary for proper production have been gained at great expense and under high pressure.

Bankers Told of Utility Needs.—Charles G. Dawes of Chicago, speaking at Sycamore, Ill., before the twelfth annual meeting of Group 3 of the Illinois Bankers' Association, declared that the future financial solvency of the public utilities of the country depends upon increased rates for their products and their services. The utilities, Mr. Dawes declared, are paying war-time prices for materials, labor and betterments, with incomes based upon peace prices. "What this means in relation to the general financial conditions in the United States," he said, "may be inferred from the fact that there is outstanding upon public utilities in the United States a bonded indebtedness amounting to \$5,143,000,000."

Manufacturers' War Service Bulletin.—The General War Service Committee of the Electrical Manufacturing Industry has sent to every electrical manufacturer a copy of War Bulletin No. 35 of the Chamber of Commerce of the United States which, it says, "constitutes an official definition of less essential industry and describes how the War Industries Board will restrain all less essential industry in promoting industry essential to winning the war." Attention is particularly directed to the comment of the war service committee of the Chamber of Commerce of the United States, inviting suggestions regarding operations under the policies of the War Industries Board to the end that the board may be assisted in the administration of its policies to the desired end.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Higher Rates to Promote Development.—The California Railroad Commission has authorized the San Joaquin Light & Power Corporation to increase all electric rates by imposing a temporary surcharge of 10 per cent on all bills. The commission provides that the surcharge shall remain effective only until the end of 1918, or until the company's increased operating expenses have been met. The decision states that the amount paid by the company for fuel alone will increase from \$60,000 in 1917 to \$325,000 in 1918. The increase is due both to a shortage of snow and rainfall on the watersheds from which the company secures the water for its hydroelectric energy and to the increased cost of fuel oil. The company is directed to send out bills as formerly and to add an additional 10 per cent to meet the present increased cost of operation. The decision also establishes rules and regulations for extensions to be made by the company.

Increase Allowed in Colorado.—In allowing an increase in electric rates by the Colorado Springs Light, Heat & Power Company the Colorado Public Utilities Commission expresses the opinion that "such increases as are necessary at this time should be borne uniformly by the majority of the consumers of the company. Increases made in a prior order in this case were confined entirely to the large power consumers. While an increase in the rates to the small consumers will be made, the commission desires to call attention to the fact that even under the present war conditions such increased rates are lower than those paid by such consumers prior to the first order affecting the rates of this company. In the opinion of the commission no change should be made in the present rates for street lighting, sign and display lighting or electric heating." The fuel clause covering large light and power service follows: "The energy charges herein provided are based on coal costing not less than \$2 nor more than \$2.50 per ton delivered at the main steam plant of the company. When such coal cost is in excess of \$2.50 per ton as shown by the records of the company for the previous calendar month, the above base rates shall be increased 0.15 mill per kilowatt-hour for each increase of 10 cents per ton, and when such coal cost is less than \$2 per ton, the above base rates shall be decreased 0.15 mill per kilowatt-hour for each 10 cents per ton decrease in the cost of coal, provided that this fuel clause shall not apply to the first 20,000 kw.-hr. of monthly consumption."

J. Hadley Hatch of the Public Service Company of Northern Illinois has been commissioned an ensign and sent to Annapolis for four months' training. Mr. Hatch is twenty-two years old. He obtained his engineering education at Northwestern University.

Charles B. Hill, vice-president and general manager of the Cooper Hewitt Electric Company, Hoboken, N. J., who has been seriously ill for the last three months and was at one time believed to be in a very dangerous condition, has practically recovered and after a rest and vacation will be able to take charge of the company's affairs again.

A. B. Cole has been appointed assistant to the manager of the department of publicity, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., to succeed M. C. Turpin, who has accepted a position in the Ordnance Department at Washington. Upon graduation in 1909 from the School of Electrical Engineering, Purdue University, where he made a specialty of steam and electric railway studies, Mr. Cole entered the engineering apprenticeship course of the Westinghouse company. He completed this work in 1911. While on the course he was engaged, in addition to the regular shop testing, on railway project work in the general engineering division and as a railway sales correspondent at East Pittsburgh and afterward in the Cincinnati district office. Recently Mr. Cole has been co-operating on publicity matters with the American Electric Railway Association war board at Washington, spending half of his time in Washington and the remainder in East Pittsburgh.

Dr. Charles W. Burrows, associate physicist of the National Bureau of Standards in charge of the magnetic section of that institution, has resigned and will take up the work of commercial research and consultation, with laboratories equipped for research on problems involving magnetic materials and apparatus, at Grasmere, borough of Richmond, New York City. In 1905 Dr. Burrows received the degree of doctor of philosophy from the University of Michigan. Since then he has been a member of the scientific staff of the National Bureau of Standards at Washington, D. C. During this period he has reduced practical magnetic testing to an exact science. The Burrows magnetic permeameter is an extensively used method for commercial as well as for precise magnetic measurements. His greatest achievement has been in the discovery and development of the science of magnetic analysis. Dr. Burrows is a fellow of the American Institute of Electrical Engineers and a member of the following committees: National Research Council, aeronautical instruments, submarine mines; National Safety Council, safety devices of the mining section; Railway Signal Association, direct-current relays; American Society for Testing Materials, magnetic testing (chairman), electrical standards, methods of testing, standing committees.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

C. A. Hall has been appointed manager of the electric light and power department of the Eastern Pennsylvania Railways Company, Pottsville, Pa., which property is operated by the J. G. White Management Corporation, New York, N. Y. After leaving school in 1904, Mr. Hall entered the employ of the Consolidated Light Company, Huntington, W. Va. In 1907 he joined the organization of the Ohio Valley Electric Railway Company at Huntington. He became superintendent of the Canonsburg (Pa.) Electric Light, Heat & Power Company in 1909, and following the purchase of this utility in 1911 by the West Penn Power Company of Pittsburgh, Pa., he was appointed local manager of that corporation in charge of the Canonsburg territory. Under Mr. Hall's management this property was entirely rebuilt and many improvements to the service were made.

Obituary

John Bottomley, vice-president and director of the Marconi Wireless Telegraph Company, died on June 16 in New York City, after a brief illness, at the age of seventy years. He was born in Ireland in 1848 and received his education at Queens College. In 1880 he came to America, took up the study of law and was admitted to the bar. In 1898 he first met Mr. Marconi and took up the task of introducing wireless telegraphy into American commerce. In 1902 he became general manager, secretary and treasurer of the Marconi Wireless Telegraph Company of America and later became vice-president. He was a past-president of the New York Electrical Society. Mr. Bottomley was a nephew of the late Lord Kelvin and a grandson of James Thomson, the scientist.

Dr. Eugene Wilson Caldwell, X-ray expert and inventor of many devices in the development of the use of this invention, died on June 20 as a result of injuries received many years ago while experimenting with the X-ray. He engaged in experimental work in telephony to lightships in 1894 and 1895 and for the next two years was assistant in the engineering department of the New York Telephone Company. In 1905 he obtained his medical degree. He became interested in the physical problem of the X-ray and was the first director of the Edward N. Gibbs Memorial X-Ray Hospital. Dr. Caldwell was the inventor of the Caldwell liquid interrupter of special forms of X-ray tubes and of many appliances for use with Roentgen rays.

C. O. Baker, president of the firm of Baker & Company, Inc., gold, silver and platinum refiners, died suddenly on June 13 in his sixty-first year. He was one of the pioneer platinum refiners in the United States and early in life had an important part in the promotion of electricity for general uses. For several years he was president of the Electrical Exhibition Company and was connected with many progressive enterprises in the electrical field. He was also for a number of years master of transportation for the National Electric Light Association.

Howard L. Coburn, for fourteen years chief engineer of the Ambursen Construction Company of New York and Boston and designer of some of the largest hydroelectric plants in the United States and Canada, died on June 21, after a short illness, of pneumonia. He was graduated from the Massachusetts Institute of Technology in 1887. Later, as a member of the firm of Lockwood, Greene & Company, he designed many of the largest cotton mills and power plants in the Southern States and New England. In 1904 he became chief engineer and director of the Ambursen Construction Company and in this capacity designed and constructed the Guayabal dam for the United States Irrigation Service in Porto Rico and the Bassano dam across the Bow River in Alberta, Canada. He also built the Shoshone and the Laprelle dams in Wyoming. In addition to this work he was associated as consulting engineer with Henry L. Doherty & Company, E. W. Clark & Company and H. M. Byllesby & Company.

P. T. Glidden, for several years manager of the Northern States Power Company, St. Paul division, died on June 18 after a lingering illness. Mr. Glidden was born in Massachusetts in 1870. At the age of nineteen he entered the employ of the Holtzer-Cabot Electric Company, leaving in 1893 to go with the Schaeffer Electrical Company. Two years later he joined the staff of the New York Edison Company and for eight years he was in the operating, business and commercial departments of the company. He spent 1903 with the Ohio Brass Company, and in 1904 he became manager of the new-business department of the Binghamton (N. Y.) Light, Heat & Power Company. After a year and a half he was elected vice-president and general manager and a few months later took charge of the Sayre (Pa.) Electric Company. A year later he became vice-president and general manager of the Easton (Pa.) Power Company, retaining management of the Binghamton and Sayre properties until he became associated with the Louisville Lighting Company. In 1913 he left Louisville to go to St. Paul as manager of the Consumers' Power Company. When this company a short time ago became the St. Paul division of the Northern States Power Company he retained the St. Paul managership. Mr. Glidden was president of the Minnesota Electrical Association during 1913-14.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

DISCOUNTS SHOULD DEPEND ON QUANTITY AND SERVICE

Economical Units of Manufacture, Cost for Distribution to Jobber and Then to Retailer the
Three Factors That Govern Price

The subject of trade discounts formed an interesting part of the address of J. Nelson Shreve, president of the Electric Cable Company, before the State convention of the New York Electrical Contractors' Association at Saratoga Springs this week.

In establishing prices, Mr. Shreve pointed out, the manufacturer must consider:

1. The most economical units in which he can manufacture.
2. A fair additional cost for distributing them in quantities used by the wholesale trade.
3. The further additional cost for distribution in quantities suitable for the retail trade.

Discount, it was stated, is the recognition by the manufacturer of the service function fulfilled by the jobber and the contractor. There are only two reasons for a discount, quantity purchase and service.

"A concern that claims maximum discounts," said Mr. Shreve, "from a manufacturer on any basis but that of quantity and service should not have the claim recognized. The fact that a concern is in the electrical jobbing or the contracting business, or a member of an association, is not sufficient reason for according the recognition asked for. To do so would be unjust to those whose services entitle them to the maximum consideration. Manufacturers' selling schedules should be arranged on a basis of differentials which attract and encourage the wholesaler to buy in the most economical units, and the retailer, in turn, to buy so as to render maximum service to the manufacturer, the jobber and the consumer."

EFFECT OF STEEL ORDER ON STOCK ACCUMULATION

Necessity of Shoving Orders of War Nature Ahead
Affords No Opportunity for Replacing Goods
Shipped from Stock

Now that it is impossible to obtain steel except where the goods are to be used for war work of some nature, a number of problems are arising that require a quick answer. According to a strict interpretation of the ruling, a manufacturer must show a bona fide war order before he can obtain a priority for steel shipment. Priority orders, however, constitute 100 per cent of steel production. Steel will not be shipped, therefore, for the manufacture of stock parts.

To carry this one step further, a manufacturer buying from a fabricator of parts cannot buy parts except for war work. If such be the condition, the manufacture for stock of goods involving steel is forbidden automatically. Such a condition would, of course, defeat the purposes of the government in many instances. In these cases business men have suggested that a remedy will soon be found and applied. Generally speaking, however, factories are filled up ahead of capacity and consequently will be able to place orders for steel coincidentally with receipt of order for finished products. In these cases no delay should result.

With the jobbers, however, the situation takes on a different complexion. Since the fall of 1915 the jobbing business has become more than ever before one of immediate de-

livery from jobber's storehouse. In order to render this service, stock naturally must be kept on hand. When the government wants some of this stock it gets it quickly, but there are no priority orders forthcoming for replenishing the stock.

In other words, the jobber by the very nature of his business is precluded from laying up a stock of steel goods after the stock held by manufacturers has been depleted. When that occurs the jobber will probably occupy the same position that he now holds with respect to conduit, the manufacturer shipping directly to the government user on jobber order.

COTTON COSTS REFLECTED IN ELECTRICAL GOODS

Advances of 100 to 350 per Cent in Cotton Goods
and Yarns Account for Much of the Higher
Cost of Insulated Wire, Tapes, Etc.

Rising prices of raw materials inevitably affect the cost of manufacturing electrical products of many kinds, though it is difficult to predict just what the influence of a given advance in raw-material cost will be upon the selling price of equipment in any particular case. There are two principal reasons for this—the latitude allowed the cost department or price-fixing branch of the manufacturing organization in compensating for the advance and the varying amounts of any particular material used in different types, forms or sizes of apparatus. Nevertheless, it is possible to instance actual figures drawn from practice to show that changes in raw or finished component material costs may have an appreciable effect upon the ultimate price of the finished product.

An investigation along this line was recently made by the ELECTRICAL WORLD with respect to the effect of price changes in cotton upon the selling price of electrical equipment. Cotton has undergone an extraordinary change in price since the beginning of the war. Spot cotton was quoted at 12.50 cents per pound in New York City on July 30, 1914, the day the Cotton Exchange closed, and on Nov. 16 of that year the price upon the reopening of the exchange had fallen to 7.75 cents. During the interim President Wilson inaugurated the "Buy a bale of cotton" movement, and at that time the price was about 10 cents. It is well known that since the fall of 1914 cotton has increased in price until it passed the 30-cent mark in the spring of this year, shot up to 36 cents or thereabout on a speculative drive, and the quotation of June 22 was 30.4 cents. Electrical insulation is dependent upon cotton as its base material, and of tapes alone probably 97 to 98 per cent are fabricated of cotton yarns. Wire covering and many other products are affected by the rising and falling prices of cotton, but it appears that the day-to-day temporary fluctuations have less influence upon the resulting cost of electrical equipment and supplies than the longer and more sweeping changes. The reason for this is doubtless that manufacturers are accustomed to purchasing raw material of a cotton base far ahead of the dates upon which this material is to be utilized in production, and the market price at some future time may be taken into account rather than the price actually paid some months previously for a given consignment of insulating material base, when the establishing of sales figures takes place.

The accompanying table gives an idea of the changes in price of gray goods, muslin, tape, varnished cloth and yarn since the war began, these increases ranging from 106 to 342 per cent. These materials all bear the marks of increased labor cost as well as of increased raw-cotton price,

and in the case of tape alone it is known that labor cost has increased certainly 50 per cent since the outbreak of the war.

On account of the increase in the price of material manufactured from cotton, the total cost of generators and motors, which are insulated with cotton tape, has been increased from 0.5 per cent to 1.5 per cent.

In the case of the coarser sizes of wire the range in price from the beginning of the war was from about 14 cents per pound to 39 cents, this being due in part of course to the increase in the price of copper and also to higher labor charges. An analysis by the cost department of a prominent wire maker indicates that of this increase probably about 7 cents per pound can properly be charged to the rise in the price of cotton from 12.5 cents to 30 cents. Magnet wire rose from 18 cents to 33 cents per pound between 1914 and 1918, and about 9 cents of this may be attributed to cotton price advance, the smaller wire having a relatively larger amount of cotton insulation.

The buyer of electrical machinery and supplies using cotton must therefore realize that raw material advances are properly a part of the increased cost of the products which he uses, and that the influence of such advances depends in large measure upon the amount of material involved in his purchase in relation to the increase in the cost of labor. The table follows:

	Before the War Prices	Last Paid Price	Approximate per Cent Ad- vance Last Paid Over Before War
68/72 gray goods.....	\$0.06 yd.	\$0.21 yd.	250
1/4 muslin	0.08 yd.	0.255 yd.	219
Cotton tape	0.385 gr. yd.	1.05 gr. yd.	173
Varnished cloth	0.108 yd.	0.307 yd.	184
Cotton yarn—coarse ..	0.215 lb.	0.95 lb.	342
Cotton yarn—fine	0.85 lb.	1.75 lb.	106

METAL MARKET SITUATION

Increased Production of Copper Assured—Imports Restricted—Price to Remain Unchanged

After the discussion about an increase in the official price of copper, it is now said there will be no change at the expiration of the time limit. The chief matter of interest taken up at the meeting last week in New York City of the producers and sales managers of the distributors of copper was that of shipments. The increased productive capacity of the mines was also brought forward, and it now appears there will be sufficient metal for all war work as well as for civilian users.

The War Trade Board has revoked all outstanding licenses for the importation of copper ore from overseas, except from Cuba, excepting for shipments made prior to June 10. No new licenses for shipments made from overseas after that date will be issued. The purpose of this regulation is to bring about the importation of copper matte (copper concentrates), instead of the bulkier crude ore.

Very slight changes have occurred in other metals.

NEW YORK METAL MARKET PRICES

	June 17	June 24
Copper:	£ s d	£ s d
London, standard spot....	110 0 0	110 0 0
Prime Lake	Cents per Pound	Cents per Pound
Electrolytic	Govt. price 23.50	Govt. price 23.50
Casting	Govt. price 23.50	Govt. price 23.50
Wire base	26.25	26.25
Lead, trust price	7.82 1/2	7.82 1/2
Nickel, ingot	40.00	40.00
Sheet zinc, f.o.b. smelter....	Govt. price 15.00	Govt. price 15.00
Spelter, spot	8.07 1/2	8.57 1/2
Tin, Chinese*	90	90
Aluminum, 98 to 99 per cent.Govt. price †33.00		Govt. price †33.90

OLD METALS

	Cents per Pound	Cents per Pound
Heavy copper and wire.....	21.50 to 22.00	21.50 to 22.00
Brass, heavy	13.50 to 13.75	13.50 to 13.75
Brass, light	10.50 to 11.00	10.50 to 11.00
Lead, heavy	6.00 to 6.50	7.00 to 7.25
Zinc, old scrap	6.00 to 6.12 1/2	6.25 to 6.50

*No Straits offering. †In 50-ton lots or more; carload, 33.10 cents per lb.; 1-ton to 14-ton lots, 33.20 cents per lb.

THE WEEK IN TRADE

ADVANCES in the price of staples and other electrical merchandise, which started on the Atlantic seaboard, have reached the central sections of the country, the Pacific and Northwest States. Some further increases in New England are also reported, with still others on certain lines predicted. Sales continue to mount in size and further activity seems certain. The purchase of electrical equipment in the Pacific Northwest is running along high levels for new construction work in the shipyards and other industrial activities directly connected with war work. This is also true in other territory where similar enterprises are established. A general demand for conduit, with low stocks and tardy deliveries, is noted at the principal points of distribution. There is a call for new line material hard to meet. Wire sales in the smaller sizes exceed last year's volume, with unusual activity in No. 14 and circular-mil sizes. Transactions in domestic appliances show an increase.

The following sales on government account are officially reported: The Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., and the Robbins & Myers Company of Springfield, Ohio, were recently awarded contracts by the United States Army Medical Corps for motor fans. The Quartermasters' Department placed an order with the Peerless Light Company of New York City for flashlights. The General Engineering Depot made contracts with the following: Westinghouse Electric & Manufacturing Company, motors; Western Electric Company of New York City, hydrometers and miconite plate; National Electric Supply Company, brake lining, rivets, patch and heat units, vulcanizers and electric fans; Sangamo Electric Company of Springfield, Ill., watt-hour meters; General Electric Company of Schenectady, N. Y., magnetos, fuses, voltmeters and other electrical material; Willard Storage Battery Company of Cleveland, Ohio, batteries.

President Wilson in an open letter has requested all employers engaged in war work to refrain, after Aug. 1, from recruiting unskilled labor excepting through the United States Employment Service. Labor conditions are unsatisfactory in spite of advancing wages, strikes and threatened strikes being numerous.

NEW YORK

No diminution in the volume of sales for the week on account of the recent advances in price is noticeable. There is evidence that jobbers, anticipating greater transportation difficulties in the fall than now, are placing orders for as large a quantity of staple goods as the manufacturers will accept. It is understood, however, that the only quotations made are those that prevail at the time of shipment.

Just what effect the increased freight rates which went into effect on Tuesday will have on the price of material and finished goods is not yet determined. The increased express rates of about 10 per cent date from Monday next, July 1. Labor shortage continues to be bothersome.

Collections are more than fair. Credits are carefully looked after. Trade acceptances are coming into more general use.

MOTORS.—On special designs of from 50 hp. to 100 hp. deliveries are very poor. Only on government orders is a preference given on priority delivery.

POLE HARDWARE.—Demand is strong, but it is getting more difficult to obtain an adequate supply. No change in prices has occurred during the week, but distributors state that revisions on a higher level may be expected.

HOUSEHOLD SPECIALTIES.—The increasing scarcity of domestic help and the trouble of holding employees is having a beneficial influence on the growing demand and enlarged sales of electric washing and ironing machines.

Sewing machines also are active, with factory deliveries weak and uncertain. Dealers and department stores have ordered freely in anticipation of the higher scale going into effect on sewing machines on Monday.

COLLECTIONS.—One jobber selling almost entirely to the government reports collections on a fifty-day to fifty-five day basis, which is about ten days longer than normal.

CONDUIT.—While conduit is in scant supply, sizes above $\frac{3}{4}$ in. are reported to be almost impossible to get. The statement that one jobber who carries a diversified stock of staples had a large quantity of conduit on hand was generally questioned. It is said that, outside of small orders which can be filled by shopping around, an order for 25,000 ft. of all sizes, if it could be handled, would command any price the seller might name.

SCHEDULE MATERIAL.—An active demand is reported for the entire line. No further change in prices is reported. Deliveries are backward and practically unaltered.

PORCELAIN.—The supply is short, and it is hard to have stocks replenished to anything near normal. Another price advance is looked for at almost any time.

LAMPS.—With accumulated stocks on standard sizes in the factories, though they are still behind on miniatures and flashlamps, a leading jobber states they never have caught up on candelabra lamps. Government orders are absorbing a large portion of the standard lamp output.

CONDULETS.—All sizes are in strong demand, with stocks low and replenishment no easy matter. No change in prices has occurred.

CHICAGO

Further encouragement was afforded those who are wishing for munition factories to come to Chicago by news that a considerable deal in real estate has been made at Riverdale, near that city, for a factory to cover several acres of ground. Ordinary building activities are still very weak. The wiring of old buildings, to which the attention of contractors has been diverted, still keeps ahead of general construction. On every side contractors in the city of Chicago are being advised to take up retail merchandising in connection with their construction activities. Among the manufacturers the steel situation, especially in regard to steel requirements for 1919, is all-absorbing. An authority in Chicago this week expressed the opinion that, even with the present demands of General Pershing, it would be possible for most of the factories to get pretty nearly all of their requirements for 1918 through the employment of seconds. The fact that steel prices did not advance on Friday, June 21, is taken to indicate that a steady influence will be exerted on the market. On the other hand, it is believed that the importance of the freight increase has not been fully appreciated. The discussion on trade acceptances at the meeting of electrical credit men in Chicago brought out that about 70 per cent of the members of this association are using the trade acceptance with results which range from fair to excellent.

Customers of jobbers who carry stocks went into the market before the freight increase took effect in some instances to buy conduit, rubber-covered wire, porcelain and other stock items, so that sales for the week just before the increase went into effect were a little higher than usual. There were no price changes this week, but further advances are expected when a full realization of the effect of the freight situation is reached. In such an item as sockets, for instance, it must be figured that there will be an increase of 25 per cent on the freight rate on the socket itself; but in addition to this there will be increased freight to pay on every product that goes into the socket.

FANS.—The cool weather of the week has interfered with an active movement for fans.

CONDUIT.—Galvanized conduit is especially scarce. Some of the jobbers have stocks of black.

DRY BATTERIES.—The prices on dry batteries have been increased to take care of the increased cost of freight. This amounts to about $\frac{1}{4}$ cent per dry battery for "Red Seal" brand in Chicago.

TAPE.—The extraordinary demand for tape has placed

most Chicago factories two months behind on delivery. Government orders are partly responsible.

BUSBAR SUPPORTS AND DISCONNECT SWITCHES.—Industrial companies are taking large quantities.

POTHEADS.—An active movement through central stations is taking place in potheads.

ELECTRIC IRONS.—The special sales week in electric irons was very successful.

RECEPTACLES.—The "more-sockets-for-more-service" campaign, now being promoted, is expected to stimulate the demand.

BOSTON

Business holds up well, with the usual war foundation and an increasing tendency toward the curtailment of non-essential industries. The government buying program seems inexhaustible. Collections are fairly good, but the electrical contractor's position is not so satisfactory as is desirable, owing to the extremely small amount of new construction work along building lines. It appears that the creation of an industrial barred zone in the East will limit development work more and more in war industries to the intensifying of production in existing plants. Here is a field for efficiency engineering, however, which will demand a good deal of electrical material in its cultivation.

FANS.—Unseasonably cold weather is holding back fan sales, and retail stocks are virtually standing still. Meanwhile the final shipments from the factories are preparing a jobbers' reserve.

FIRE-ALARM TELEGRAPH APPARATUS.—Municipal buying is rather below normal, although many systems now in service are relatively out of date and should be replaced. Curtailment by cities and towns is the cause of light business. The government, on the other hand, is installing a large amount of protective equipment in its plants, arsenals and navy yards. Fire protection in shipyards is an extremely live subject and is receiving the attention of engineers in many localities. Price advances have been slower than in many lines, probably not over 25 per cent in the last two years, but a further advance of about 10 per cent is expected in the near future.

MOTORS.—Shipments ordered six or eight months ago are now coming in, but the demand is so heavy that stocks are soon depleted. The country is being combed for large-sized units. A recent order for four 350-hp. motors was filled through Denver, Col., the units being rewound at St. Louis and shipped to Bridgeport, Conn., for munitions plant operation. Second-hand motor prices are following the same upward trend observed in new machinery. Small motors are fairly easy to obtain, at least in odd sizes. An inquiry at the end of last week for twelve 50-hp. machines for immediate delivery could not be satisfied.

INSULATING MATERIAL.—Ebony wood advanced in price about 10 per cent within a fortnight, and stocks are very low, owing to government demands. Prices hold firm on plain asbestos, with little opportunity to accumulate stocks of any real size. Large stocks of fiber conduit are on hand against the long-deferred time of central-station expansion. Government work takes less of this material than is often supposed, only about 2000 ft. being required even in a plant like the destroyer plant at Squantum.

INTERIOR TELEPHONE APPARATUS.—Industrial sales are at low volume, except in war plants working under great time pressure.

STORAGE BATTERIES.—Deliveries are hard to obtain, and stocks are accordingly low.

CONDUIT.—Stricter limitation of shipments to orders carrying priority numbers is the order of the day. Stocks are spotty, and the trend is toward reduced totals. It is difficult to see how an advance in price can be much longer postponed, in view of increased freight rates and the enormous demand for steel.

BATTERY-CHARGING EQUIPMENT.—Small motor-generators are in heavy demand, and controlling equipment, while not maintained in sizable or complete stocks, is being supplied on a four weeks' delivery basis. Some delay in the delivery of meters for panel service is being met.

ATLANTA

The Southeastern Section of the N. E. L. A. meeting at Atlanta, Ga., is the chief item of interest in the industry this week. Although in some cases central stations have been allowed to increase rates, a large number of petitions are being heard or waiting to be heard before the various state commissions. Monthly statements show that net earnings are growing less as the year advances, and while the commissions realize these conditions it is not expected that their work can be expedited unless the federal government suggests immediate relief in the way of surcharges.

Official announcement was authorized to the effect that Camp Hancock, Augusta, Ga., will be transferred from a tented to a regular cantonment type of army post, and at the same time an additional camp will be constructed with a new name. Both camps will house approximately 90,000 men for machine-gun and ordnance training. Preliminary estimates place expenditures for this work at \$4,000,000. Docks, terminals and warehouses will be constructed for the government at New Orleans, La., costing \$10,000,000. The Southern Truck & Car Corporation of Greensboro, N. C., has been organized with a capitalization of \$1,000,000 for the manufacture of 1-ton motor trucks. The International Graphelt Corporation of Birmingham, Ala., with a capital of \$1,000,000, will develop graphite properties in Alabama.

HEATING APPLIANCES.—Irons, grills and toasters are moving briskly, especially in Georgia and Florida. One manufacturer reports business for the first five months as being away ahead of the same period last year and the value per order 40 per cent higher.

TRANSFORMERS.—The demand for the larger power type from central stations has fallen off considerably. The call for the distributing type, however, remains steady. Factory facilities have improved and local stocks are coming up, even in the face of present transportation difficulties. A substantial order from a large central station, covering subway type, was reported by one manufacturer.

WIRE AND CABLE.—A power company this week has asked for bids on a large quantity of varnished-cambric lead-covered cable. The week has witnessed a big demand for both rubber-covered and weatherproof from No. 14 up to circular-mill sizes. Deliveries on the smaller sizes are being made from stock, and promises of four to six weeks on the heavier cables are being made.

SEATTLE

The volume of sales by both jobbers and dealers continues at high levels, although extraordinarily large sales are lacking. The volume to shipyards and allied plants is sustained, as were sales pertinent to new construction. Transportation congestion, both outgoing and incoming, is extremely irritating and is arousing constant worry and embarrassment. The labor situation shows no improvement.

The War Finance Corporation has granted the Northwestern Electric Company of Portland, Ore., a loan of \$1,000,000 to complete its steam-electric plant to serve the shipyards' and industrials' increasing needs. In the past week a contract was signed for the biggest job of telephone construction ever attempted in Clallam County. The Board of Public Works of Seattle has opened bids for furnishing generator sets, motors, transformers, poles, etc., costing approximately \$70,000. The Lewis County Commissioners have granted a franchise to the Central Light & Manufacturing Company to erect power lines in about six towns and along highways.

The wooden shipyard of Seattle, with six ways, has changed hands. Immediate improvements and enlargements are planned. Work doubling the capacity of Tacoma's steel shipyard to eight ways is started. The improvement also includes the construction of a 300-room hotel, dining and recreation hall, hospital, offices, machine shops and foundry, to cost approximately \$500,000. The housing campaign in Portland involves the construction of about 600 dwellings.

The embargo against all shipments of fir lumber for cross-arms, wood stave pipe, etc., issued by the Fir Production Board, is believed to be only temporary.

CONDUIT.—The demand is steadily increasing with the continued building of new shipyards and the expansion of established plants. Jobbers generally report low stocks, increasing demands and tardy deliveries. The policy of substituting in colors and sizes is relieving the local situation.

PORCELAIN.—The demand shows a continued upward trend which is met with insufficient stocks. Deliveries are extremely slow with no improvement in sight. Calls for new line construction are hard to meet. Industrial demands have priority rights and at present practically absorb the supply.

WIRE.—The volume of sales the past two weeks shows a decided increase from industrial and constructional sources. The amount of smaller sizes, used in residence construction, far exceeds the demands of years past. Shortages of all sizes exist. Shipments are irregular and unsatisfactory. Prices show no increase of moment.

MOTORS.—The larger sizes are extremely hard to obtain, but the smaller sizes are coming through comparatively quite well. The demand for larger sizes has not been heavy the past three weeks, but the demand for the smaller sizes continues brisk. Jobbers as a whole report stocks shot to pieces with no early signs of improvement. The demand from the shipyards is improving, although the improvement is felt to be only temporary. Stocks are being replenished slowly. The industrial demand continues large.

DOMESTIC APPLIANCES.—Washing machines were prime movers last week and the movement is growing. Jobbers believe a shortage of female help will further increase sales. Sales of electric ranges, irons, etc., are also on the increase. Demands are met to date but an acute shortage is imminent unless deliveries improve.

SAN FRANCISCO

Reviewing the present electrical conditions, one finds ordinary staple house-wiring business to be a small percentage of its normal volume. Dealers' counter business is poor, although there is a brisk sale for larger household devices. Industrial and government business is large, although mostly covering maintenance material rather than new construction, for the time being at least. There is no change in the status of credits or in the character of collections.

Los Angeles building permits for May totaled 639, valued at \$1,306,000. The workmen's housing question is growing more serious. Fifty bungalows are to be erected near Lodi, costing from \$1,500 to \$2,000 each. One hundred cottages, valued at from \$2,000 to \$3,000 each, are to be erected in the vicinity of Vallejo, the seat of the great government navy yard of Mare Island. Other government work reported covers a quarter-million-dollar marine hospital at the Presidio in San Francisco and the alterations and additional construction at the San Francisco mint. The State of California is receiving bids for the construction of a large State building in Sacramento.

TAPE.—The higher grades of tape have just advanced 10 per cent. The commercial grades of friction tape are now within 25 per cent of the value of rubber tape.

FUSE PLUGS.—Fuse plugs have just advanced 10 per cent, selling now in package lots at 5 cents each on the Pacific Coast to dealers.

FLEXIBLE CONDUIT.—Flexible non-metallic conduit has just advanced 17 per cent. Sales are not running so high as last year by perhaps 15 per cent.

SCHEDULE MATERIAL.—Stocks of switches and similar material have advanced from 15 to 20 per cent, following close on the heels of a 10 per cent advance of a few weeks ago.

TELEPHONE MATERIAL.—Very little extension work is reported on rural telephone lines or by the government lines.

BAKE OVENS.—The general coal situation has produced a number of interesting inquiries for electric bake ovens and large electric ranges. A large electrical equipment has recently been installed in Camp Curry and is reported as being very satisfactory.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Farm Lighting Plant of Many Uses

Additional devices such as water pumps, milking machines, etc., can be operated by a direct-connected farm lighting plant that is being marketed by the Beaudette & Graham Engineering Company, 10 Lincoln Street, Boston.

EXTRA PULLEY ON SHAFT DELIVERS
MECHANICAL ENERGY

ton. This is accomplished by means of a small extra pulley attached to the extension shaft of the engine which permits a belt to be used. The multipolar ball-bearing generator is driven by a four-cycle, 1100-r.p.m., $2\frac{1}{2}$ -hp. water-cooled gasoline engine and is semi-automatic.

Combination Steam and Electric Radiator

Heat can easily be obtained from a combination steam-electric radiator which in reality is an electrically operated steam-flash generator. This radiator is marketed by the Electro Steam Radiator Company, 125 South Wells Street, Chicago. The device has the same appearance as the steam or hot-water radiator. The radiator is tightly sealed under a vacuum so that the same water is used over and over again as the heat-producing medium. The heating element used in the radiator is manufactured by the General Electric Company of Schenectady, N. Y.

Washing Machine for Use with Small Lighting Plant

Some of the washing machines manufactured by the Grinnell Washing Machine Company of Grinnell, Iowa, can now be used with the ordinary Delco lighting outfit. They are equipped with a special Emerson electric motor rated at 32 volts, 8 amp. and 1600

r.p.m. The machine is run by means of an internal gear connected directly to the motor. The manufacturers claim that they are economical in the use of electricity. The wringer of this washer not only swings but locks in position and is driven directly by the main shaft. Drains eliminate the necessity of lifting and stooping in the use of the washer.

Adjustable Fixture for Industrial Use

A line of adjustable fixtures for industrial use has been developed and placed upon the market by the American Fixture Company, 232 West Water Street, Milwaukee, Wis. These fixtures are simple in design and are capable of many variations. Both of the parts are of sheet steel, and they are welded together by acetylene. With a stock of various sizes it is possible to make up very quickly almost any style and size of fixture desired. The fixture may be attached to the ceiling, wall or floor, at the same time allowing the light to be directed in any direction by use of the universal joint. Furthermore, the man-

ANY STYLE OF FIXTURE CAN BE MADE
FROM STOCK PARTS

ufacturers state that once the fixture has been placed in a certain position it will retain that position until it is manually changed.

Automatic Rack for Electric Soldering Irons

Electric soldering irons which are left lying on a bench or other convenient place when not in use gather dirt and become a hazard. If the current is turned off, the iron cools down to such a degree that considerable delay is caused when the iron is again desired for use. To overcome this the Cutler-Hammer Manufacturing Company of Milwaukee and New York has recently developed an automatic soldering iron rack and control panel which is said to decrease the amount of energy taken by the iron. It keeps the iron from overheating, prevents burn-outs and saves energy. The rack consists of a small slate panel arranged for wall

mounting and carrying a support for the iron which acts on the principle of the telephone receiver hook. When the iron rests on the support or hook it bears the support down and resistance which is mounted on the back of the panel is inserted in circuit with the iron. Taking the weight from the hook disconnects the resistance from the soldering iron circuit and allows full current to flow. Below the hook, on the same panel, there are a push-button switch and a receptacle to which the

IRON KEPT WARM WHEN NOT IN USE

plug of the soldering iron cord is connected.

The little panel is therefore a complete switchboard which may be mounted on the wall or machine within reach of the workman. When not in use and at night the switch is snapped "off," which completely opens the circuit to the iron. These automatic racks are designed for use with Cutler-Hammer soldering irons, but may be used with similar types as well.

Well-Balanced Induction Motor

Conservatism of design is a feature that is claimed for an induction motor manufactured by the Cleveland Electric Motor Company, 5519 Euclid Avenue, Cleveland, Ohio. It is designed so to proportion the various electrical features as to secure the motor best suited for general service conditions. No characteristic has been unduly developed at the expense of other qualities, but the whole design has been well balanced. The manufacturers claim that high efficiency and power factor are obtained; the starting torque is high and the maximum or pull-out torque and overload capacity are very liberal. The air gap has been made as large as possible for good design. The motor is very efficiently ventilated and has low operating temperatures. The constant-speed squirrel-cage induction motor illustrated is designated as type "M." For large starting torque or where the current is to be kept at a

minimum value the wound-rotor type of motor is used. This motor is designated as type "MW." Both types are made in ratings of from 2 hp. to 50 hp. in standard frequencies of 60, 50, 40 and 25 cycles for either two-phase or three-phase and 110, 220 or 550-volt service. Continuously rated motors will carry full load for twenty-four hours

MOTOR IS WELL VENTILATED

with a temperature rise of not over 40 deg. C. and 25 per cent overload for two hours with a rise of 55 deg. C.

Powerful currents of air are set up by the rotor fans. These currents are directed by the bracket housing through the rotor, winding around and over the center coils, and out through the ventilation ducts provided by the fingers on the stator end ring. All parts of the motor are effectively exposed to this ventilation, and cooling does not depend upon radiation alone.

Generator for Charging Storage Batteries

Storage batteries for lighting automobiles and motorcycles can be efficiently charged by means of a generator recently placed upon the market by the Carleton Company, 170 Summer Street, Boston, Mass. The generator is designed to charge any 6-volt battery, but its output at normal speed is 7 volts and 7 amp.

Bus-Type Disconnecting Switches

Flexible disconnecting switches that can be attached directly to the busbar are shown in the accompanying illustration.

SWITCH BLADE CAN BE PLACED IN ANY POSITION

tration as manufactured by the Delta-Star Electric Company, 2433 Fulton Street, Chicago. These switches are made for attaching to either round or

flat busbars with various ratings as desired. By means of adjustable clamps they may be held in any position on the busbars and they have terminal connection lugs that can be clamped to either the front or the rear surface of the load switch terminal. The switch blades can be placed in line with or at right angles to the bus or in any intermediate position desired.

Washing Machine with Safety Features

A washing machine equipped with an automatic safety stop, an automatic conveyor and a safety release is being manufactured by the Chicago Dryer Company, 624-630 South Wabash Avenue, Chicago. The driving mechanism of the wringer is so arranged that in event of clothes winding around the rubber rolls the wringer is automatically thrown out of gear and stops instantly. There is no necessity for touching levers of any kind in an emergency. The mechanism is adjustable, and adjustment may be made so that the wringer will stop on a light, medium

WRINGER AUTOMATICALLY STOPS IF ANYTHING IS WRONG

or heavy pressure. By pushing the lever at the top of the wringer the cross-bar is instantly released and the top rubber roll is raised about 6 in. (15.2 cm.) above the lower roll. This safety release is another feature. The automatic conveyor consists of a revolving roll in front of the rolls of the wringer. As this conveyor revolves it carries the clothes into the rubber rolls of the wringer, thus eliminating the necessity of bringing the hands or fingers close to the rubber rolls when feeding. A 1/6-hp. motor is used to drive these machines.

Direct-Connected Motor-Driven Pump

For obtaining vacuum in heating plants the Viking Pump Company, Cedar Falls, Iowa, is manufacturing a line of motor-driven, direct-connected pumps. The pump with a condensation tank is installed in the return pipe line and arranged so that when the tank becomes filled to a certain level the switch automatically starts the pump and operates it until the tank is emptied. The switch then breaks the cir-

cuit. It is claimed that these pumps handle liquids of any viscosity, ranging from ether and gasoline to the heaviest liquid.

Motor-Driven Lawn Mower

A lawn mower in which the 20-in. (51-cm.) blades are driven by a 1/6-hp. electric motor is being manufactured by the Palmer Electric Company,

GRASS MAY BE CUT WITH A MINIMUM PHYSICAL EFFORT

50 Park Place, Detroit, Mich. The motor is also made in another style, using 1/4 hp. and driving 31-in. (76-cm.) blades. On this machine the motor is belted to the shaft on which the blades are attached, which has no connection with the wheels of the machine. The machine must be manually pushed, but the motor revolves the blades so that the only physical effort required is that of getting the mower over the ground. Energy is supplied to the motor through a long, flexible waterproof cord.

Automobile Valve Grinder

Valves for automobiles can be efficiently and smoothly ground by means of a valve grinder that has been placed upon the market by the Stenman Electric Valve Grinder Company, Inc., 42 Southbridge Street, Worcester, Mass. The manufacturers claim that this grinder will operate on any type of valve made and will give a perfect seal in a very short time. A feature of the grinder is the oscillating motion produced, which has a frequency of 800 oscillations per minute.

Inclosed Safety Switch

An inclosed safety switch approved by the Industrial Accident Commission of California and the Department of Electricity of the city of San Francisco is being manufactured by the California Electrical Construction Company, 641 Mission Street, San Francisco, Cal. The switches are simple, safe, self-locking and cannot get out of order, according to the manufacturers. They are known as the "Ceco" and are inclosed in a black enameled box with hinged cover. Its construction is such that when the switch is closed the box is locked, and to open the box the switch must first be opened.

Trade Notes

THE GARDNER ELECTRICAL MANUFACTURING COMPANY has removed from Ray Point to Emeryville, Cal.

BRITAIN'S ELECTRIC MOTOR COMPANY is the new name of the Langdon-Davies Electric Motor Company of London, Eng.

THE EDISON STORAGE BATTERY COMPANY of Orange, N. J., has opened a sales office at 740 Land Title Building, Philadelphia. J. A. Hurst, sales engineer of the Edison company, is in charge.

THE WAR TRADE BOARD of Washington, D. C., in supplement No. 4 of May 31, publishes a "Cumulative Supplement to Enemy Trading List, Revised." It contains additions, removals and corrections from March 15 to May 31.

THOMAS A. EDISON, INC., of Orange, N. J., on July 1 will inaugurate an eight-hour day with time and a half for overtime. This means a wage increase of \$500,000 and affects 8000 employees. The plant was formerly on a ten-hour basis.

E. M. RAETZ of the Foster-Raetz Electric Company of Rochester, Minn., has associated himself with Paul D. Richardson, Minneapolis, Minn., in the sale of the Stromberg electric time systems and the "Autocall" signal system for the Northwest.

THE WESTINGHOUSE ELECTRIC PRODUCTS COMPANY, formerly operating under the name of the Copeman Electric Stove Company, has removed its plant from Flint, Mich., to Mansfield, Ohio. The purchase of the Mansfield property was referred to in a previous issue of the ELECTRICAL WORLD.

THE AMERICAN CHAMBER OF COMMERCE of Paris, France, in its fortnightly information pamphlet, publishes a list of articles which are prohibited for exportation and re-exportation. Among other commodities is given that of compositions of products for electric insulation and tubes and pipes for boilers.

THE SMITH & HEMENWAY CO., INC., of New York City, whose plant at Irvington, N. J., is very largely given over to the making of tools for the government, is completing another building. New machinery of the latest design is being installed. Late last year the factory in Hill, N. H., added a new building.

THE LALLEY-WILSON ELECTRIC COMPANY of Omaha, Neb., distributor for the Lallely electric light and power plants for farm use in four States, desires to secure catalogs, literature and jobbers' prices on 32-volt motors and 32-volt appliances of all kinds, together with lighting fixtures and wiring appliances suitable for 32-volt plants. The company is preparing its first catalog.

THE CORN EXCHANGE NATIONAL BANK of Philadelphia has issued a pamphlet entitled "What Other Nations Have Done to Help Their Disabled Soldiers and Sailors." The information is compiled largely from reports and publications issued by the authority of the British Ministry of Pensions, and includes also data from Belgian, French and American sources.

THE AVERY & LOEB ELECTRICAL COMPANY of Columbus, Ohio, has discontinued its electrical contracting business, according to reports, and is devoting its energies to the jobbing of supplies and fixtures. This has required additional room, and for the purpose the company has acquired 2100 sq. ft. more floor space, making 30,000 sq. ft. in all and covering five floors and basement of the building occupied. The sales organization has been augmented by several young women.

THE BOOTH-HALL COMPANY of Chicago, metallurgists, engineers and builders of electric furnaces, has just concluded arrangements with the Bradford-Ackermann Corporation, 30 East Forty-second Street, New York City, to take entire charge of sales in the eastern section of the United States. C. C. Bradford and A. H. Ackermann are both graduate electrical engineers. Mr. Ackermann was formerly vice-president and general manager of the United States Heat & Light Corporation, Niagara Falls, N. Y., and Mr. Bradford was general sales manager of the same company.

KOCH & SANDIDGE of Chicago is a new firm handling the sales engineering work for the "Jiffy" cutting tools and similar products made by the Universal Tool & Appliance Company of Milwaukee, Wis. Paul W. Koch, although a partner in the business, will remain active as presi-

dent and general manager of the Electrical Sales Engineers, Inc., of Chicago. He is a graduate of Illinois University. John H. Sandidge has been connected with the Cooper Hewitt Electric Company for more than six years, being sales manager in the Chicago district for five years and recently Wisconsin manager with offices in Milwaukee. He was at one time with the Commonwealth Edison Company as illuminating engineer for its contract department. Mr. Sandidge is a graduate of Tulane University. He will also become associated with the Electrical Sales Engineers, Inc., in selling products of the Condit Electrical Manufacturing Company.

THE CONTINENTAL PIPE MANUFACTURING COMPANY has purchased the plants and good will of the following long-established concerns: Pacific Coast Pipe Company, Seattle; Washington Pipe & Foundry Company, Tacoma; National Tank & Pipe Company (pipe department), Portland; Portland Wood Pipe Company, Portland. The general offices of the company are at 4515 Fourteenth Avenue, N. W., Seattle, Wash. The Eastern offices of the company are in the Woolworth Building, New York City. Plants for the manufacture of wire-wound and continuous-stave pipe are operated in Seattle, Tacoma and Portland. Officers of the Continental company are: Leo H. Long, president, formerly president of the Washington Pipe & Foundry Company; T. B. Garrison, vice-president, formerly president of the Pacific Coast Pipe Company; F. M. Kirsch, vice-president, formerly vice-president of the National Tank & Pipe Company; W. E. Russell, secretary, formerly vice-president of the Washington Pipe & Foundry Company, and L. Murray Grant, general manager. Mr. Grant was chief engineer of the Pacific Coast Pipe Company. A strong technical staff has been built up by the new organization, the following well-known engineers being included, the former connections of each being indicated: H. D. Coale, National Tank & Pipe Company; R. B. Fulton, Pacific Coast Pipe Company; E. J. Bartells, Pacific Creosoting Company, and Frank C. Kelsey, who takes the New York offices of the Continental Pipe Manufacturing Company in the Woolworth Building.

Trade Publications

MOTORS—The Wagner Electric Manufacturing Company, St. Louis, Mo., has issued a calendar poster.

LIGHTING UNITS.—"Peelites" lighting units are described and illustrated in a circular that is being distributed by the Peerless Light Company, Chicago.

SUPPORTING STRIPS.—The Ohio Distributing Company, Chicago, Ill., has issued a circular describing the Kruse metal supporting strips for switchboxes.

CLAMPS AND SWITCHES.—W. N. Matthews & Brother of St. Louis, Mo., have issued a circular describing and illustrating their "Fuswitch" and boltless clamps.

DESK AND PIANO LAMPS.—"Verdelite" desk and piano lamps are described in a booklet that has been issued by the Faries Manufacturing Company of Decatur, Ill.

DISCONNECTING HANGARS.—"The Human Nature Side of Lamp Cleaning" is the title of a circular being distributed by the Thompson Electric Company, Cleveland, Ohio.

WASHING MACHINES.—The "1900" washing machine is described and illustrated in a circular being distributed by Wallace B. Hart, 46 East Forty-first Street, New York City.

PLACARDS.—The Cleveland service office of the Burke Electric Company, Erie, Pa., is distributing a placard emphasizing the fact that electricity should be saved whenever possible.

ELECTRIC SPECIALTIES.—The Anderson Electric Specialty Company, 118 South Clinton Street, Chicago, has published list No. 2B, describing and illustrating the Anderson dental and laboratory appliances.

PAPER.—The Mitchell-Rand Manufacturing Company, 99 John Street, New York, is circulating a card to which is attached a sample of "Tuflex" red-rope paper for use in armature slots and various other places in generators and motors.

BALL BEARINGS.—The U. S. Ball Bearing Manufacturing Company, Chicago, has compiled and is distributing some data sheets of information regarding dimensions of all types of Strom bearings.

Engineering data and other information of interest are also included in this catalog.

POCKET WIRING CHART.—The engineering department of the National Lamp Works of the General Electric Company has issued a wiring chart for use in selecting the proper size of wire for country home-lighting installations. This chart, together with installation suggestions for country home lighting, is made in a convenient pocket size and is contained in a protecting envelope.

BALL BEARINGS.—The first edition of the "New Departure Ball Bearing Manual," which is a practical guide for users of ball bearings is being distributed by the New Departure Manufacturing Company of Bristol, Conn. This is a complete and concise treatise on ball bearings and discusses the best installation practice and also improved methods of lubrication and adjustments. It includes full descriptions and dimensions of the "New Departure" double-row and single-row "Radax" magneto ball bearings.

WROUGHT-IRON PIPE.—A dot chart showing the corrosion of iron versus steel pipe in hot-water mains has been compiled by the A. M. Byers Company, 235 Water Street, Pittsburgh, Pa. This chart is based on a recent investigation of the hot-water lines in 125 buildings. Brass was used in about thirty-five of these buildings, steel in twenty-five and iron in sixty-five. All the records obtained, giving name and location of each of the buildings investigated, are contained in Byers Bulletin No. 30, which is also being distributed.

New Incorporations

THE GARBER (OKLA.) LIGHT & ICE COMPANY has been incorporated with a capital stock of \$20,000 by William Musser and others.

THE MASSILON (OHIO) ENGINEERING & ELECTRIC COMPANY has been incorporated with a capital stock of \$15,000 by J. E. and J. M. Lewis.

THE GLEN BROOK POWER COMPANY of Munfordville, Ky., has been incorporated with a capital stock of \$30,000 by R. D. Lane, C. R. Garden and H. A. Watkins.

THE BELTHOOVER ELECTRIC COMPANY of Cincinnati, Ohio, has been incorporated with a capital stock of \$20,000 by Charles M. Belthoover, John D. Belthoover, George M. Belthoover and others.

THE LOUISVILLE (KY.) STORAGE BATTERY COMPANY has been chartered with a capital stock of \$15,000 by W. G. Heist, A. G. Heist and Walter Huffaker. The company proposes to manufacture storage batteries.

THE BOYLAN & CONROY COMPANY of Geneva, N. Y., has been chartered by H. H. Burdick, C. R. Conroy and W. L. Boylan of Hornell. The company is capitalized at \$20,000 and proposes to manufacture farm tractors and electrical accessories.

THE LINN GROVE (IND.) LIGHT & POWER COMPANY has been incorporated by Harry Meshberger, Rufus Meshberger, Albert A. Yordy, George S. Gottschalk and Michael Miller. The company is capitalized at \$10,000 and proposes to generate and distribute electricity.

THE AREWELL CORPORATION has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$2,000,000 for the purpose of manufacturing electrical machinery. The incorporators are: M. M. Clancy, C. L. Rimlinger and F. A. Armstrong.

THE FALLS EQUIPMENT COMPANY of Niagara Falls, N. Y., has been incorporated with a capital stock of \$100,000 to manufacture electrical, mechanical, heating and lighting equipment. The incorporators are: F. W. Korff, 152 North Transit Street, Lockport, and C. Jones and R. D. Glennie of La Salle.

THE TURBINE ENGINEERING CORPORATION of Buffalo, N. Y., has been incorporated with a capital stock of \$100,000 by J. A. Carmon, 47 High Street; C. J. Bush, 549 Grider Street, and A. L. Vickery, Exeter Terrace, Buffalo, N. Y. The company proposes to manufacture engines, machinery, turbines, etc.

W. L. HOLAHAN, INC., of New York, N. Y., has been incorporated by W. L. Holahan, M. A. Holahan, 44 West Sixty-fifth Street, and L. Holahan, 404 West Fifty-eighth Street, New York City. The company is capitalized at \$50,000 and proposes to do a general electrical engineering business, trucking business, lumber-merchant, coach-building business, etc.

New England States

NASHUA, N. H.—The New England Power Company has petitioned the City Council for right of way over certain highways for the erection of an electric transmission line to supply electricity to the mills of the Nashua Manufacturing Company.

FAIRHAVEN, VT.—Preparations are being made by the Western Vermont Power & Light Company to rebuild its substation at the plant of the Eureka State Company near Lake Bomosen, recently destroyed by fire. The loss is estimated at \$5,000.

BOSTON, MASS.—Contract has been awarded by the Navy Department, Washington, D. C., to Chandler & Joyce, 178 High Street, Boston, for alterations and improvements to the power plant at the local navy yard. The cost of the work is estimated at \$31,000.

GARDNER, MASS.—The Selectmen have ratified a contract with the Gardner Electric Light Company to furnish 750 electric street lamps at \$18.75 each per year. After July 1 gas street lamps (93) will be discontinued, which will be replaced with electric lamps.

HOLYOKE, MASS.—Contract has been awarded by the Worthington Pump & Machinery Corporation for an addition to machine shop, 90 ft. by 200 ft., and addition to foundry, 80 ft. by 180 ft., at its Dean Works in Holyoke.

ORANGE, MASS.—Contract has been awarded by the New Home Sewing Machine Company of Orange for the construction of an addition to its plant, to cost about \$75,000. Other large extensions are contemplated by the company.

SHERBORN, MASS.—Plans are being prepared for the erection of a large power plant at the Sherborn Reformatory for Women, to cost about \$70,000.

Middle Atlantic States

ALBANY, N. Y.—Bids will be received by W. W. Wotherspoon, superintendent of public works, Capitol, Albany, until July 23, for furnishing, testing and delivering electric capstans and trolley hoists at Pier 6, East River, and West Fifty-third Street Pier, New York City, and electric capstans at the Utica Terminal Pier, under terminal contract No. 109. Plans may be seen and specifications, blank form of contract, etc., may be secured at the above office, at the office of the assistant superintendent of public works for the Middle Division at Syracuse; at the office of the assistant superintendent of public works for the Western division at Rochester, and at the canal office, Spaulding Exchange, Buffalo, N. Y.

BROOKLYN, N. Y.—Paul M. Marko & Company, 1101 Bedford Avenue, have filed notice of increase in capital stock from \$50,000 to \$75,000, the proceeds to be used for business extensions. The company manufactures storage batteries, etc.

BUFFALO, N. Y.—Plans have been filed by the Buffalo General Electric Company for the construction of an electric power station, 100 ft. by 100 ft., to cost about \$25,000.

BUFFALO, N. Y.—Plans have been prepared by the Pullman Company, Marine Bank Building, for the erection of a new power house, to cost about \$27,000, at its works at 1770 Broadway.

BUFFALO, N. Y.—The National Aniline & Chemical Company is contemplating the construction of a machine shop, to cost about \$85,000, at its plant on Abbott Road. Plans are also being prepared by the company for an addition, 200 ft. by 200 ft., at its works.

GALWAY, N. Y.—Plans are under consideration by the board of managers of the Saratoga County Homestead Sanitarium for the construction of an addition to the power plant at the institution, to cost about \$12,000.

GARDENVILLE, N. Y.—Plans are being prepared by the Pennsylvania Railroad Company for the erection of a new engine plant, in connection with additions to its local plant, to cost about \$75,000.

NEW YORK, N. Y.—Bids will be received by Thomas J. Drennan, fire commissioner, eleventh floor, Municipal Building, New York City, until July 8, for furnishing cable. Blank forms and further information may be obtained on application to the above office.

NIAGARA FALLS, N. Y.—Plans have been prepared for an addition to the plant of the United States Light & Heat Corporation, 3215 Highland Avenue.

ROCHESTER, N. Y.—The Bridgeford Tool & Machine Works, Winton Road, North, contemplates the construction of a new

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

power plant at its works. A. H. Ingle is president.

WARWICK, N. Y.—A new electric power plant will be built in connection with the group of buildings to be erected at Warwick by the Board of Inebriety, 300 Mulberry Street, New York City. The cost of the buildings is estimated at about \$200,000. Chauncey Matlock, 30 East Forty-second Street, New York City, is electrical engineer. Sylvan S. Levy is president of board.

BAYONNE, N. J.—Plans have been prepared by Shattuck & Hussey, 19 South La Salle Street, architects, Chicago, Ill., for the recreation building to be erected and equipped by the Associated Industry of Bayonne, to cost approximately \$250,000. The building will be wired for elaborate lighting and for motors required for pumps and ventilating fans.

BURLINGTON, N. J.—Plans are being prepared for a new boiler plant and cold storage room at the State Masonic Home, Jacksonville and Oxhead Roads, to cost about \$35,000.

DOVER, N. J.—The new plant of the New Jersey Power & Light Company is nearly completed and will soon be placed in operation. The old station at Boonton will probably be closed down.

HAMBURG, N. J.—At an election held recently the proposal to appropriate \$1,500 for lighting the streets of the town was rejected.

HOPEWELL, N. J.—Plans are under consideration by the Borough Council for the installation of new electrically operated pumping equipment at the municipal water-works.

JERSEY CITY, N. J.—Plans have been filed and contract awarded by the Erie Railroad Company for the construction of a new power house, 35 ft. by 85 ft., at its local works.

KEARNY, N. J.—The Federal Shipbuilding Company has acquired two additional tracts of land adjoining its works at Kearny on the Hackensack River, one 249 ft. by 1472 ft. and the other 250 ft. by 954 ft., which will be used for proposed expansion of the plant.

NEWARK, N. J.—Contract has been awarded by the Nucuo Butter Company, Fourth Street, to the American Concrete Steel Company, 31 Clinton Street, Newark, for the erection of a large power plant, 100 ft. by 100 ft., at its works, to cost about \$40,000.

NEWARK, N. J.—Arrangements are being made by the Star Electric Motor Company, 245 New Jersey Railroad Avenue, Newark, for the construction of a new plant to be located at New Jersey Railroad Avenue, Miller and King Streets, to cost about \$25,000.

PASSAIC, N. J.—Preliminary plans are being prepared for a new power house about 80 ft. by 150 ft., for the New York Baiting & Packing Company, 91 Chambers Street, to be erected at its local plant on Passaic Street. Lockwood, Greene & Company, 101 Park Avenue, New York, N. Y., are architects and engineers.

POMPTON LAKES, N. J.—Bids will be received by the Borough Council, Pompton Lakes, until July 2 as follows: (1) For the erection of a hydraulic power plant building; (2) two vertical hydraulic turbines; (3) two electric generators and switchboards. Plans and specifications are on file in the office of J. Frank Cornelius, borough clerk. S. Firestone is consulting engineer.

TRENTON, N. J.—Plans are being prepared for the installation of two electrically operated pumping units of 20,000,000 gal. capacity per day at the municipal water-works station. One of the units is to be of high lift and the other of the low lift type.

CHESTER, PA.—Plans have been completed by Clarence W. Brazer of Chester for the construction of a new town in Tinicum Township, near the Westinghouse Electric & Manufacturing Company's plant near Essington, which will include the erection of 1154 buildings and involve an expenditure of several million dollars.

CHESTER, PA.—The Emergency Fleet Corporation has entered into an agreement with the Public Service Commission for the construction of a new electric railway along the Chester Pike, extending from Chester

to Darby, to cost about \$1,000,000. This line is to provide transportation facilities for workers in the nearby shipbuilding plants and other industrial plants engaged on government contracts.

MIDDLEBURG, PA.—Plans are being considered by the Juniata Public Service Company, which is negotiating for the purchase of the property of the Middleburg Light, Heat & Power Company, to connect the plant of the State Center Electric Company of State College and the plant of the Juniata Public Service Company. The latter company is planning to increase the output of its plant to about 5000 hp.

NICETOWN, PA.—Considerable new equipment will be required for the new gun plant of the Midvale Steel & Ordnance Company to be erected at Nicetown, which will include 27 electrically driven cranes, as follows: Five 100-ton, one 75-ton, eight 50-ton, one 30-ton, three 25-ton, eight 10-ton, and one 5-ton; also turning lathes, grinders, drills, milling machines, etc.

PHILADELPHIA, PA.—Work has begun on the erection of a transformer building for the Philadelphia Rapid Transit Company, to be erected at Eightieth Street and Eastwick Avenue. The cost of the building is estimated at about \$30,000.

PITTSBURGH, PA.—Contract has been placed by the McClintic-Marshall Company for 50 six-ton cranes and eight 10-ton cranes with Manning, Maxwell & Moore for the extensions to be made to its Pottstown fabricating plant. The company also contemplates the purchase of machine tools and additional crane equipment for both its Pottstown and Rankin plants.

WILMINGTON, DEL.—The United States Shipping Board has awarded the contract for the construction of Union Park Gardens at Wilmington, to provide homes for workers employed in the shipyards in the vicinity of Wilmington, to the Lynch Construction Company of Waterbury, at \$2,500,000. The contract provides for the installation of public utilities including a water service, gas and electric light systems, etc.

CURTIS BAY, MD.—Plans are being prepared for the erection of three buildings, each 60 ft. by 110 ft., for the Curtis Bay Copper & Iron Works, to be used as machine shops, and other work for the manufacture of copper and iron specialties as well as ship repair parts and castings. The main office of the company will be located at South Baltimore. William F. Cochran is chief engineer.

LANGDON, D. C.—Contract has been awarded by the Corby Company for the erection of a new boiler plant at its works in Langdon, to cost about \$10,000, to F. L. Wagner, 1413 H Street, N. W., Washington.

WASHINGTON, D. C.—The Bureau of Yards and Docks, Navy Department, contemplates the construction of a power house at St. Julien's Creek (specification No. 3072), to cost about \$75,000.

WASHINGTON, D. C.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until July 5 for supplying to the various federal buildings, marine hospitals and quarantine stations under the control of the Treasury Department portable desk lamps during the fiscal year ending June 30, 1919.

WASHINGTON, D. C.—Bids will be received at the office of the purchasing agent of the Post Office Department, Washington, D. C., until July 9 for furnishing electrical supplies, baggage trucks, etc., for the use of the postal service as they may be ordered from time to time during the fiscal year beginning July 1, 1918, and ending June 30, 1919. Blanks for proposal and further information may be obtained upon application to the purchasing agent.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., to be delivered at the various navy yards and naval stations as follows: Various, Schedule 1839—182,000 dry flashlight batteries, 68,000 flashlights without batteries; Schedule 1845—miscellaneous dynamo, engine and fire room clocks; Schedule 1861—miscellaneous prismatic reflectors and globes, miscellaneous globes, shades, etc., Norfolk, Va.; Schedule 1845—400 single and double throw switch boxes, Brooklyn, N. Y.; Schedule 1849—400 coating trucks. Applications for proposals should designate the schedule desired by number.

North Central States

CINCINNATI, OHIO.—William T. Johnston Company, Third and Vine Streets, Cincinnati, is reported to be in the market for a 100-kw., 220-volt, three-wire gener-

ator directly connected to engine, (Skinner) preferred.

CINCINNATI, OHIO.—The Union Gas & Electric Company of Cincinnati has closed a contract with the United States government to furnish all the power required for the new nitrate plant of the government to be located at Elizabethtown, about 20 miles from Cincinnati. The plant, it is expected, will be ready for full operation about Jan. 1, 1912, and will require about 35,000 kw. daily. Electricity will also be furnished by the company during the period of construction. A new station equipped with two generating units of 30,000 kw. each has just been completed. Work will begin at once on the installation of an additional unit of 30,000 kw., bringing the total output to 90,000 kw.

FINDLAY, OHIO.—The Grant Motor Corporation of Cleveland has awarded the W. J. Thompson & Son Company of Cleveland the general contract for the construction of three one-story buildings, 50 ft. by 190 ft., 50 ft. by 146 ft. and 30 ft. by 66 ft., respectively; two buildings, 50 ft. by 210 ft., and an office building, at its Findlay plant. The plant will be used for the machining of 155-mm. shells. The W. S. Ferguson Company of Cleveland has charge of the engineering work.

FULTON, KY.—The Illinois Central Railroad Company is contemplating the erection of various units at Fulton, including a boiler house, 40 ft. by 150 ft., two 150-hp. boilers, one 85-ft. electric turntable, etc., to cost about \$225,000. A. S. Baldwin, 135 East Eleventh Street, Chicago, Ill., is chief engineer.

LOUISVILLE, KY.—The Board of Public Works has asked local architects to prepare plans for the proposed river warehouse and terminal. The installation of electrically operated trams to carry freight from the steamboats to the warehouses is under consideration.

LOUISVILLE, KY.—The Board of Water Works has authorized President S. Zorn to ask for bids for a new pumping engine, from 30,000,000 to 40,000,000 gal. per day, for the Crescent Hill plant, and also for the purchase of boilers and new equipment for the Riverside station.

MUNFORDVILLE, KY.—The Glen-Brook Power Company, recently incorporated with a capital stock of \$30,000, is contemplating the construction of a power plant. R. D. Lane and others are interested in the company.

CANNELTON, IND.—Plans have been prepared for a new building, 230 ft. by 130 ft., at the works of the Indiana Cotton Mills, to provide space for additional looms. The building will be equipped with all modern appliances and will cost more than \$200,000.

FRANKFORT, IND.—Steps have been taken by the City Council for improvements to the municipal electric-light plant.

HAMMOND, IND.—The Standard Steel Car Company has awarded contract to Manning, Maxwell & Moore for a 1000-ton hydraulic press to be installed in its Hammond works; also for accumulator, pumps and accessories.

INDIANAPOLIS, IND.—The Cleveland, Cincinnati, Chicago & St. Louis Railroad Company is contemplating new construction work involving an expenditure of about \$11,000,000, which will include the construction of a new roundhouse and terminal at Galion, Ohio, to cost about \$1,000,000, and improvements at its terminal in Cincinnati, to cost about \$500,000. E. M. Costin, Indianapolis, Ind., is general superintendent.

NOBLESVILLE, IND.—Plans are being prepared by the Noblesville Heat, Light & Power Company for the erection of a dam across White River near Noblesville. It is estimated that sufficient power can be developed to operate about one-third of the plant. The cost of the work is estimated at about \$100,000. A. R. Holliday of Indianapolis is president and general manager.

LINCOLN, ILL.—The City Council is considering an issue of \$35,000 in bonds to acquire property necessary for the operation of the Lincoln municipal electric railway.

PEORIA, ILL.—Estimates are being secured by the Holt Manufacturing Company, which manufactures caterpillar tractors, on equipment for a new machine shop. The three shops now operated by the company are driven by electric power.

KENOSHA, WIS.—John D. Chubb, architect, 109 North Dearborn Street, Chicago, Ill., has been engaged by the Board of Education to prepare plans for two school buildings, each 150 ft. by 300 ft., two and three stories and basement, with manual training and domestic science departments.

KENOSHA, WIS.—Arrangements have

been completed by the Whither Motor Truck Company, now operating at Whithrop Harbor, Ill., for the erection of a new plant in Kenosha, where a site of 10 acres has been acquired. The main building will be 125 ft. by 300 ft. Considerable machinery and tools will be required.

MADISON, WIS.—A site has been purchased in Madison by Armour & Company on which it is proposed to erect a new cold storage and refrigerating plant, warehouse and branch headquarters building, to cost about \$75,000.

MILWAUKEE, WIS.—Plans have been completed and contracts will soon be awarded by the Globe Seamless Steel Tubes Company for the erection of two shop extensions, 130 ft. by 250 ft. and 130 ft. by 175 ft., at its main plant at Thirty-seventh and Burnham Streets, West Milwaukee. Orders, it is understood, will be placed at once for three electrically operated cranes and miscellaneous tools. Frank J. O'Brien is general manager.

RHINELANDER, WIS.—The Rhinelander Light & Power Company is contemplating the installation of a new turbo-generator unit (500 to 750 kw.) in its substation. Alterations and improvements in the water-works station are also under consideration by the company. E. A. Forbes is president and general manager.

WAUSAU, WIS.—The installation of a central lighting and heating plant in Wausau is reported to be under consideration by local business men.

HATFIELD, MINN.—The local dam of the hydroelectric plant of the Wisconsin Railway, Light & Power Company was recently damaged, causing a loss of about \$30,000.

ST. PAUL, MINN.—Bids will be received by the Minnesota State Board of Control, State Capitol Building, St. Paul, until July 2, for construction of the power house and laundry building and greenhouse, including general contract work, heating and ventilating, plumbing and electrical work, at the State Hospital for Crippled Children, Phalen Park, St. Paul. Plans and specifications may be obtained upon application to C. H. Johnston, architect, 715 Capital Bank Building, St. Paul, upon deposit of \$25.

WAHKON, MINN.—The General Light & Power Company of Carlton has submitted a proposal to the Commercial Club to supply electric service to the village of Wahkon.

NEOLA, IOWA.—At an election held recently the proposal to issue \$10,000 in bonds for improvements to the municipal electric-light plant and water-works system was carried.

SCHALLER, IOWA.—The Council is considering an issue of \$35,000 in bonds for the installation of a municipal electric-light plant.

WATERLOO, IOWA.—Bids are being received by the Board of Education, Waterloo (to close in July, no date set), for the construction of the Kingsley High School, including electric wiring, steam heating, vacuum cleaner, etc. The cost of the building is estimated at from \$140,000 to \$150,000. J. G. Ralston, Syndicate Building, Waterloo, is architect. J. E. Dempster, Lovitt & Johnson Building, is secretary of board.

KANSAS CITY, MO.—The L. Breitag & Son Construction Company, 3701 West Prospect Street, has been awarded the general contract for the construction of substation No. 2 at 101 Oak Street, for the Kansas City Railways Company. The proposed building will be 82 ft. by 48 ft., and will cost about \$25,000. Contracts for electric wiring, heating, plumbing, etc., will soon be awarded. C. E. Fritts is electrical engineer.

ST. JOSEPH, MO.—Plans are nearing completion and bids will soon be asked for the construction of a store building, including electric wiring, steam heating, plumbing, etc., for the Townsend & Ueberrhein Clothing Company to be erected at the corner of Sixth and Felix Streets, at a cost of about \$100,000. The plans provide for the installation of one or two electric passenger and freight elevators. Eckel & Aldrich, Corby-Forsee Building, are architects.

WEBB CITY, MO.—The Southwest Missouri Railroad Company is contemplating the construction of a railroad from Pilcher to Miami, Okla., a distance of 18 miles, to cost about \$150,000. The work will include roadbed, ties, rails, stations, cables, poles, cross-arms, etc. A. H. Rogers of Webb City is president.

PIERRE, S. D.—The municipal electric-lighting and water plant was recently destroyed by fire, causing a loss of about \$100,000.

HAVELOCK, NEB.—Contract has been awarded by the Hebb Motor Company for electric wiring for its new manufacturing plant to W. H. Petersen. The cost of the

plant is estimated at \$250,000. W. J. Assemacher, Orpheum Building, Lincoln, is general contractor. A. F. Hebb, 1333 P Street, Havelock, is owner.

SHELDON, NEB.—Contract will soon be awarded by the Nebraska Conference of Adventists, care of J. S. Rouse, College View, Neb., for the construction of a school dormitory, including electric wiring, heating, plumbing, etc. The cost of the building is estimated at about \$60,000. Elery Davis, Mutual Life Building, Lincoln, is architect.

AUGUSTA, KAN.—Bonds to the amount of \$45,000 have been voted for improvements to the municipal electric-light plant.

CHENEY, KAN.—Preparations are being made by the city of Cheney to erect an electric transmission line from the line of the Tri-County Light & Power Company to Cheney, a distance of about 12 miles, for which bids have been received.

KANSAS CITY, KAN.—Contracts, it is reported, will soon be awarded by the St. Mary's Academy, Leavenworth, for the construction of a hospital, three stories, 50 ft. by 105 ft., with two wings, 50 ft. by 60 ft., on Eighteenth and Taumoe Streets, in Kansas City, to cost about \$200,000. Wight & Wight, First National Bank Building, Kansas City, Mo., are architects.

MANHATTAN, KAN.—Bids will be received by J. A. Kimball, business manager, board of administration, Topeka, until July 9 for remodeling the old Agricultural Building at the Kansas State Agricultural College, to cost about \$50,000. Proposals will be asked later (separate contracts) for electric wiring, heating, plumbing, etc. Ray L. Gamble, Topeka, is state architect.

MORAN, KAN.—Improvements are contemplated to the water-works system, including the installation of an engine and generating unit, to cost about \$10,000.

PERU, KAN.—Preliminary plans are being prepared by Archer & Stevens, New England Building, Kansas City, Mo., for the construction of an electric-light plant and waterworks system in Peru, to cost from \$30,000 to \$35,000.

WOODSTON, KAN.—A company has been organized by local business men to construct and operate an electric-light plant in Woodston. The company is capitalized at \$10,000. Frank Shuttee is president and P. D. Scott is treasurer of the company.

Southern States

BRADENTOWN, FLA.—The installation of a municipal electric-lighting plant is under consideration by the City Council.

MIAMI, FLA.—Owing to the government having commandeered the machinery ordered for the new municipal electric light and water power station, it will be some time before it will be ready for operation. Work on the new well is progressing.

ST. PETERSBURG, FLA.—Bids will be received by the Board of Public Instruction of Pinellas County, Dixie M. Hollins, superintendent, Clearwater, until July 9 for electrical work in the St. Petersburg High School, St. Petersburg. Specifications may be obtained from the superintendent, Clearwater, and William B. Futner, architect, St. Louis, Mo.

COAL CREEK, TENN.—Contract has been awarded by the Magnet Knitting Mills of Clinton to the A. J. Stair Construction Company of Coal Creek for the construction of a mill building, 200 ft. by 60 ft., to cost about \$20,000. The building will be equipped with 550 knitting machines driven by electric motors, costing about \$50,000. Manley & Young, Holston Building, Knoxville, Tenn., are architects.

BIRMINGHAM, ALA.—Charles T. Lehman, 1921 Powell Avenue, Birmingham, is in the market for an air compressor of from 2000 to 3000 ft. capacity; three 150-hp. Scotch marine boilers and locomotive, economic or other portable types, must be over 1000-lb. pressure; one 200 to 250-kw. direct-current generator and three 90 to 110-hp. portable locomotive boilers.

TUCKER, ARK.—The Pine City Electric Company of Pine Bluff has been awarded contract to install an electric-lighting system at Penal Farm, to cost about \$3,500.

NEW ORLEANS, LA.—The economizer and boiler in the central power plant at Market and South Peters Streets of the New Orleans Railway & Light Company recently exploded, causing a loss of about \$50,000.

NEW ORLEANS, LA.—Plans have been completed by the Foundation Company, 233 Broadway, New York, N. Y., for the construction of a new shipbuilding plant at New Orleans, which will include four shipways, with machine shop, fabricating shop

riveting works and other structures for the manufacture of steel vessels. The cost is estimated at about \$1,000,000.

DURANT, OKLA.—The Durant Grain & Elevator Company, it is reported, will purchase machinery for an elevator with a capacity of 150,000 bushels and a mill with a daily output of 500 barrels. E. M. Stewart is manager.

PONCA CITY, OKLA.—The City Council is contemplating an issue of \$35,000 in bonds for improvements to the municipal electric-light plant.

YALE, OKLA.—The City Council has engaged Henry A. Pressy, City Hall, Oklahoma City, engineer, to prepare plans for the proposed municipal electric-light plant and waterworks system. An election will soon be called to vote on the proposal to issue \$200,000 in bonds for the work.

CHANDLER, TEX.—E. L. Green of Chandler, it is reported, is contemplating the construction of an electric-light and power plant in Chandler.

COLEMAN, TEX.—The City Council is considering extensions to the waterworks, involving an expenditure of about \$100,000, increasing the capacity from 500,000 to 1,000,000 gal. The proposed work will include the construction of a pumping station and possibly a 5,000,000-gal. dam.

FORT WORTH, TEX.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until July 18 for the installation of an electric passenger elevator, etc., in the United States post office and court house at Fort Worth. For details see Search-light section.

HOUSTON, TEX.—Contract has been awarded by the Houston, Richmond & Western Traction Company for the construction of the first section of 30 miles of its proposed electric railway that is to run between Houston and San Antonio, a distance of 186 miles, to Howard Kenyon of Houston. This section will extend from Houston to the Brazos River, a distance of 30 miles.

MARSHALL, TEX.—The Marshall Mill & Elevator Company is contemplating rebuilding its grain elevator and flour mill, recently destroyed by fire, at a cost of about \$75,000.

MARSHALL, TEX.—Arrangements are being made by the Texas & Pacific Railway Company to rebuild its shops at Marshall, recently destroyed by fire. The loss is placed at \$500,000, and includes main machine shops, tool room and power plant, air brake and coppersmith departments.

ORANGE, TEX.—The Orange Ice, Light & Water Company contemplates the purchase of a new 750-kw. generator and turbine and other machinery for its electric and water plant. It will also drill several additional artesian wells.

SABINAL, TEX.—The project of Charles A. Lindsey of Kansas City, Mo., and associates for the construction of a water storage and irrigation system near Sabinal, to cost about \$3,000,000, it is reported, meets with the approval of the State Board of Water Engineers. The plans provide for the construction of a dam across the Frio River at a point where two bluffs make what is known as a shut-in of that stream, where a large hydroelectric power plant will be installed. From this plant transmission lines will be extended to San Antonio, Uvalde, Sabinal and other towns and cities within a radius of 125 miles. Water will be furnished at first to irrigate about 50,000 acres of land, and will ultimately be extended to 200,000 acres.

Pacific and Mountain States

OLYMPIA, WASH.—Application has been made to the State engineer by George W. Dilling of Seattle for 11,000 second-feet of water from Skagit River, to be used for power purposes. It is estimated that 40,000 hp. can be developed at a cost of \$2,000,000.

PE ELL, WASH.—The Central Light & Manufacturing Company of Pe Ell has been granted a franchise by the Commissioners of Lewis County to erect and operate an electric transmission line along the National Park Highway from Walville to Meskill and to use the streets of the unincorporated towns of Walville, McCormick, Doty, Dryad and Meskill. The franchise covers a period of 50 years. The company will connect with the lines of the North Coast Power Company at Meskill.

SEATTLE, WASH.—J. D. Ross, superintendent of lighting, will recommend the immediate change from fuel oil to some substitute (owing to the scarcity of fuel oil) at the municipal electric power plant at Lake Union.

WENATCHEE, WASH.—The Chelan Falls Power Company has applied to the Commissioners of Chelan County for per-

mission to erect and operate an electric transmission in Chelan County.

KLAMATH FALLS, ORE.—The committee appointed by the City Council to consider the offer of the Keno Power Company to sell its light and power plant to the city, has reported that the city is financially unable to accept the offer.

PORTLAND, ORE.—The War Finance Corporation has given its approval of a loan of \$1,000,000 to the Northwestern Electric Company of Portland. The proceeds will be used for extensions to its system to enable it to furnish additional energy to be used in connection with shipbuilding plants.

ALAMEDA, CAL.—Work will be begun by the Bethlehem (Pa.) Shipbuilding Corporation on the construction of a new shipyard in Alameda on the San Francisco Bay. This yard will have its own fabricating machine, forge and boiler shops for making of all ship equipment. Orders, it is understood, will soon be placed for about 100 cranes, including both traveling and locomotive types.

LOS ANGELES, CAL.—The Pacific Electric Railway Company has awarded contract for the construction of a substation at Slauson Junction to A. Nelson, at \$3,341.

LOS ANGELES, CAL.—Government aid to the amount of \$10,000,000 or more will be asked by the city of Los Angeles for the development of 210,000 hp. of hydroelectric power along the aqueduct under a plan launched by Mayor Woodman for a monopoly of power distribution in Los Angeles. Two objects are sought by the Mayor in the proposed project: First—To obtain a monopoly for the municipal power bureau of the distribution of power in Los Angeles; second—To release large quantities of fuel oil and natural gas now consumed by the gas and electric plants and private industries for domestic use. In return for this loan the city will offer the government first option on the 210,000 hp. of hydroelectric energy developed with this fund.

NEWPORT, CAL.—A committee has been appointed by the City Trustees to make investigations relative to the installation of electric lamps in Newport Heights. The city electrician, it is reported, has been instructed to purchase the necessary materials.

OCEANSIDE, CAL.—Plans are being considered by the Board of Supervisors for the installation of an electric street-lighting system in Oceanside.

RICHMOND, CAL.—Plans are being considered by the International Vegetable Oil Company for the construction of a large plant, which will require about 300 hp. in motors.

SAN FRANCISCO, CAL.—The Pacific Gas & Electric Company has decided to increase the height of Lake Spaulding. It has not yet been decided whether to raise it 10 ft. or 15 ft., with cost \$130,000 or \$200,000 respectively.

SAN FRANCISCO, CAL.—Work is progressing rapidly on the Hetch Hetchy project. The Eleanor dam, it is expected, will be completed by July 1. The 4000-hp. hydroelectric power plant at Early Intake, in three units, will soon be placed in operation; the transformers, compressors and other equipment for tunnel aqueduct have been installed. At the end of this aqueduct the second large power plant of over 50,000-hp. will be started.

SAN FRANCISCO, CAL.—An agreement has been signed by the Pacific Gas & Electric Company, the California-Oregon Power Company and the Northern California Power Company whereby the three systems will co-operate to cope with the war-time shortage of power for expanding industrial needs. Under the arrangement made a supply of 8000 kw. additional energy will be assured to the Pacific Gas & Electric Company throughout the year and 12,000 kw. during the winter months. The new construction required in this plan will involve an expenditure of about \$750,000, to be used as follows: (1) To reinforce and reconstruct the transmission line of the California-Oregon Power Company from Copco to Costella and to erect a 70,000-volt transmission line from Costella to Kennett of sufficient capacity to transmit 8500 kw. to the Northern California Power Company at Kennett; (2) the California-Oregon Power Company to finance the Northern California Power Company to the extent required to reinforce that company's line from Coleman to near Hamilton by the addition of a copper conductor to the west line to deliver to the Pacific Gas & Electric Company 8000 kw. at Colusa; (3) the Pacific company to erect a 60,000-volt transmission line from Colusa Corners, near Colusa, to the Drum-Cordelia; also to erect a 100,000-volt line and install a substation of 12,000-kw., 60,000/100,000 volts to deliver energy to that line. The construction work

for the Pacific Gas & Electric Company will be in charge of P. M. Downing, chief engineer; for the California-Oregon Power Company, P. O. Crawford and W. W. Shepard; for the Northern California Power Company, Edward Whaley, general manager.

SALT LAKE CITY, UTAH.—The Utah Power & Light Company has petitioned the Public Utilities Commission for permission to extend its system into the town of Perry, where it proposes to supply electricity for lumps, heaters and motors. The company has a franchise from the town for the proposed extension.

SALT LAKE CITY, UTAH.—Preparatory to beginning a large development, the Pope-Shenon Company, operating in the Salmon River country, has awarded a contract for the erection of a 9-mile electric transmission line, work on which will be started at once. The company has purchased considerable new machinery. The management, it is believed, will ultimately build a rail for the treatment of ores.

CONRAD, MONT.—Bonds to the amount of \$10,000 for lighting system have been sold.

SANTA FE, N. M.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until July 10 for repairs to heating, plumbing, conduit and wiring and lighting fixtures, etc., in the United States courthouse, etc., at Santa Fe.

Canada

PRINCETON, B. C.—The Kettle Valley Railway Company, it is reported, has purchased the cement plant buildings and property at East Princeton, which includes the power plant now under lease to the Canada Copper Corporation.

VANCOUVER, B. C.—The B. C. Box Company is contemplating the construction of a mill and box factory, with a daily capacity of 20,000 ft. The proposed plant will be driven by electricity.

VANCOUVER, B. C.—The Beaver Cove Lumber & Pulp Company, London Building, Vancouver, is contemplating the construction of lumber and pulp mills at Beaver Cove, to cost about \$250,000. W. H. White is general manager.

GLADSTONE, MAN.—The installation of a municipal electric-light plant to cost about \$15,000 in Gladstone is under consideration.

GODERICH, ONT.—The National Shipbuilding Company is reported to be considering the construction of a factory and concrete boiler shops, to cost about \$75,000.

PERTH, ONT.—The Hydro-Electric Power Commission of Ontario has purchased the High Falls power site at Perth.

WINDSOR, ONT.—Bid will be received by the Essex Border Utilities Commission at the office of Morris Knowles, Ltd., Royal Bank, Windsor, until July 8 for furnishing and testing three motor-driven pumping units, one having a normal rating of 500 imperial gal. per minute, and two having a normal rating of 1000 imperial gal. per minute. Plans and specifications are on file in the above office and in the office of Morris Knowles, Inc., 1200 Jones Building, Pittsburgh, Pa.

CHICOUTIMI, QUE.—The controlling interest in the property of the Saguenay Light & Power Company, which operates an electric light and power system in the town of Chicoutimi and surrounding country, has been acquired by the Chicoutimi Pulp Company, a subsidiary of the North American Pulp & Paper Company.

MONTREAL, QUE.—The high-tension transmission line of the Southern Canada Power Company with necessary substations, etc., connecting the cities of Sherbrooke and Granby and intervening territory has been completed and is now in operation. The substation is located in Granby. The company is also erecting an additional high-tension line between Drummondville and Sherbrooke.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until July 5 for furnishing refrigerating apparatus, block tin pipe, copper tubing, brass tubing, sheet brass, etc. Blanks and information relating to this circular (No. 1221) may be obtained at the above office or the offices of the assistant purchasing agents, 21 State Street, New York City; 606 Common Street, New Orleans, La.; and Fort Mason, San Francisco, Cal.

Record of Electrical Patents

Notes on Recent United States Patents

1,267,457—Clip

- 1,267,413 (115886). TRANSFORMER; Charles Le G. Portescue, Pittsburgh, Pa. App. filed May 4, 1916. Relates to the windings and insulation of transformers which are adapted for use with very high-voltage circuits.
- 1,267,415 (115887). LOAD INDICATOR FOR MOTOR TRUCKS; Frederick J. Troll, Baltimore, Md. App. filed July 20, 1917. Electromechanical means which may be applied to any motor truck.
- 1,265,421. FUSE DEVICE; Edmund O. Schweitzer and Alfred Herz, Chicago, Ill. App. filed March 13, 1914. Fuse devices intended for out-door overhead work.
- 1,267,418. SIGNALING BORN; William Kalsling, Chicago, Ill. App. filed June 11, 1914. Signaling devices for use with automobiles and motor boats.
- 1,267,433. AUTOMATIC SWITCH; James L. McQuarrie, Montclair, N. J. App. filed Dec. 30, 1916. Provides a switch for use in small telephone exchanges.
- 1,267,454. CIRCUIT CONTROLLER; Walter C. Reed, Dalton, Mass. App. filed Jan. 30, 1913. A circuit-controlling device of that type in which provision is made for opening and closing one or more electric circuits.
- 1,267,457. CLIP; Joseph Sachs, Hartford, Conn. App. filed July 26, 1916. Provision by which a conductor can be maintained in electrical connection with the clip.
- 1,267,470. RINGER; Frank M. Slough, Elyria, Ohio. App. filed May 8, 1914. Ringers to be used in connection with telephones.
- 1,267,483. ELECTRIC CONTROLLER; Kenneth M. Walley, Chicago, Ill. App. filed Jan. 19, 1914. Mechanism for controlling the intensity of electric current.
- 1,267,516. LOCK SWITCH; Warren R. Cox, Cleveland, Ohio. App. filed Sept. 7, 1915. A lock switch for the electrical ignition circuit of an automobile engine.
- 1,267,538. AUTOMOBILE SIGNAL; Edward J. Gensler, Buffalo, N. Y. App. filed June 7, 1916. Traffic signals for use on automobiles.
- 1,267,587. SOUND-REPRODUCING APPLIANCE; Herman G. Pape, New York, N. Y. App. filed Feb. 28, 1916. Relates to improvements in telephone receivers.
- 1,267,603. ELECTRIC SNAP SWITCH; Clarence C. Stirling, Hartford, Conn. App. filed Oct. 19, 1917. Switching members that can be easily and readily snapped between on and off positions through the agency of a single element.
- 1,267,604. SNAP SWITCH; Clarence C. Stirling, Hartford, Conn. App. filed Oct. 19, 1917. Snap switches of type involving the use of only a single element.
- 1,267,633. AIR SPEED INDICATOR FOR USE ON AEROPLANES AND THE LIKE; Frederic H. Clift, Barnes, London, England. App. filed Sept. 21, 1917. Indicators for denoting the speed at which aeroplanes are traveling.
- 1,267,673. MEANS FOR BONDING RAILS; Frederick C. Lavarack, Orange, N. J. App. filed Jan. 18, 1914. Means for double bonding rails for railway signal work.
- 1,267,711. ELECTRIC CONTROLLER; Orne H. Torgersen, Chicago, Ill. App. filed June 11, 1917. Electrical controlling mechanism for compressed-air apparatus.

- 1,267,743. TELEPHONE SYSTEM; Wilson L. Campbell, La Grange, Ill. App. filed Oct. 7, 1907. Systems in which automatic service is provided.
- 1,267,751. VEHICLE SIGNAL; Harry C. Fairchild, Maplewood, N. J. App. filed Feb. 27, 1917. Vehicle signals operable in response to movement of the brake lever of the vehicle.
- 1,267,755. MAGNETO MACHINE; Harry E. Geist, Racine, Wis. App. filed April 12, 1916. Magnetos for ignition purposes.
- 1,267,767. STREET - TRAFFIC - CONTROLLING APPARATUS; Benjamin M. Harris, San Francisco, Cal. App. filed Oct. 18, 1916. Provides a variation in the character of the signals automatically.
- 1,267,784. TELEPHONE SYSTEM; Talbot G. Martin, Chicago, Ill. App. filed Oct. 7, 1913. Automatic or semi-automatic telephone systems.
- 1,267,804. DEVICE FOR MOISTURE AND GAS PROOF TELEPHONE SETS; Eugene A. Reinke, Rochester, N. Y. App. filed May 13, 1915. Devices for use in mines.
- 1,267,817. SYSTEM OF CONTROL; Ray Stearns and William S. H. Hamilton, Schenectady, N. Y. App. filed March 24, 1916. An improved system of control for traction motors arranged for regenerative braking.
- 1,267,820. HOISTING SYSTEM; William C. Stevens, Summit, N. J. App. filed March 2, 1916. Hoisting systems for dock hoists.
- 1,267,828. DYNAMO - ELECTRIC MACHINE; John B. Wiard, Lynn, Mass. App. filed Sept. 28, 1917. Relates to the ventilation of dynamo-electric machines.
- 1,267,832. FILLED CABLE AND FLUID STOP; James Wilkinson, Pittsburgh, Mass. App. filed June 2, 1917. Provides a method of filling a portion of a stranded cable with a solidifiable fluid.
- 1,267,838. DYNAMO - ELECTRIC MACHINE; Sven R. Bergman, Lynn, Mass. App. filed Jan. 12, 1911. Means for ventilating dynamo-electric machines efficiently.
- 1,267,868. ELECTRIC CONDUCTOR; William C. Hayman, Schenectady, N. Y. App. filed March 9, 1916. Insulated electric conductors having coverings provided with one or more colored marking threads.
- 1,267,875. CASING FOR LAMP SOCKETS AND THE LIKE; Charles J. Klein, Milwaukee, Wis. App. filed April 8, 1912. Relates to incandescent lamp sockets, and more particularly to the non-current-carrying parts of such devices.
- 1,267,911. DISTRESS SIGNAL; Maurice Scholder, New York, N. Y. App. filed Oct. 13, 1916. Distress signals and fire alarms.
- 1,267,914. ELECTRICAL MEASURING INSTRUMENT; Robert Shand, Lynn, Mass. App. filed May 19, 1916. Improved instrument of the solenoid type.
- 1,267,916. SYSTEM OF CONTROL; Frank H. Shenard, New Rochelle, N. Y. App. filed April 29, 1915. Control systems for electric railway motors.
- 1,267,969. CURRENT-CONVERTING MACHINE; Arthur R. Bullock, Cleveland, Ohio. App. filed June 19, 1913. Provides a device in which the current converted is commutated.
- 1,267,980. AUTOMATIC TELEPHONE EXCHANGE SYSTEM; Edward B. Craft, Hackensack, N. J. App. filed Dec. 19, 1914. Automatic switches for distributing calls.
- 1,267,983. DYNAMO - ELECTRIC MACHINE; James F. Curtis, Pitcairn, Pa. App. filed Feb. 9, 1914. Provides means for the reliable ventilation of certain types of dynamo-electric machines.
- 1,267,987. AUXILIARY SIGNAL SYSTEM; Lewis Degen, Pasadena, Cal. App. filed May 11, 1917. Signaling system for sending and receiving fire alarms.
- 1,267,993. DYNAMO - ELECTRIC MACHINE; George M. Eaton, Pittsburgh, Pa. App. filed May 4, 1915. Field-magnet pole pieces built up of laminations.

- 1,267,996. COIL SUPPORT FOR DYNAMO-ELECTRIC MACHINES; Allan B. Field, West Cliff-on-Sea, England. Provides means for bracing and spacing the overhanging end portions of coils of such machines.
- 1,267,997. COIL-SUPPORTING MEANS; Allan B. Field, West Cliff-on-Sea, England. App. filed Jan. 30, 1914. Means for supporting the overhanging end portions of coils of such machines.
- 1,268,014. AUTOMATIC PROTECTIVE DEVICE; Karl Karpplinen, Brisbane, Queensland, Australia. App. filed June 7, 1917. An automatic device for shunting excessive electrical potentials and amperages.
- 1,268,020. VENTILATING APPARATUS; Jan A. Kuyser, Edgewood, Pa. App. filed March 3, 1914. Ventilating means for dynamo-electric machines provided with two-layer armature windings.
- 1,268,025. ARC LAMP; George M. Little, Pittsburgh, Pa. App. filed Oct. 3, 1913. Improvements in supporting and guiding means for the movable electrodes of such lamps.
- 1,268,026. ARC LAMP; George M. Little, Pittsburgh, Pa. App. filed April 6, 1915. Regulating and feeding mechanisms of focusing-type arc lamps.
- 1,268,052. SYSTEM OF CONTROL; Laurence M. Perkins, Wilkinsburg, Pa. App. filed March 13, 1916. Systems of control of electric railway motors and the like during the regenerative period.
- 1,268,068. AUTOMATIC MANUAL TELEPHONE SYSTEM; Bernard D. Willis, Chicago, Ill. App. filed Jan. 18, 1910. Systems in which automatic switches are employed.
- 1,268,069. AUTOMATIC COMMON-BATTERY TELEPHONE SYSTEM; Edward D. Fales, Chicago, Ill. App. filed Nov. 6, 1906. Provides certain features of improvement.
- 1,268,072. COMBINED SELECTOR AND REPEATER APPARATUS FOR LOCAL-BATTERY TELEPHONE EXCHANGE SYSTEMS; Talbot G. Martin, Chicago, Ill. App. filed July 22, 1907. Relates to automatic or semi-automatic telephone exchange systems.
- 1,268,102. ELECTRIC LIGHT EXTENSION DEVICE; John B. Drumm, Winslow, Ariz. App. filed Aug. 31, 1914. Provides a compact drum mounting wherein the contacts are completely housed.
- 1,268,106. TELEPHONE SYSTEM; Adolf Franke, Grunewald, near Berlin, Germany. App. filed Sept. 3, 1913. Automatic telephone systems in which connections are established by means of selectors.
- 1,268,111. SYSTEM OF CONTROL FOR ELECTRIC ELEVATORS; Floyd C. Furlow, Montclair, N. J. App. filed Nov. 5, 1915. Provides means to control an elevator car automatically.
- 1,268,154. HANDY LAMP; Ralph R. Root, Cleveland, Ohio. App. filed May 4, 1914. A handy lamp that may be affixed upon a metal surface and supported by magnetic attraction.

1,267,483—Electric Controller

- 1,268,156. CONTROL MECHANISM FOR AUTOMATICALLY OPERATING APPARATUS; Harold Rowntree, Kenilworth, Ill. App. filed Sept. 29, 1913. Provides means for successively registering the calls for the operations of the apparatus.
- 1,268,173. ELECTRIC SWITCH; Alfred J. Stecker, Detroit, Mich. App. filed Jan. 18, 1917. Electric switches which may be conveniently operated by the thumb or finger.
